thread-like processes, called pseudopodia, interlacing each other so as to form a net like a spider's web. Internally the sarcodebody exhibits no structure or definite organs of any kind. A nucleus, which at one time was believed to be absent, has, however, been discovered in these organisms. So far as yet known the foraminifera were the earliest of created beings, the oldest known fossil (Eozoon canadense, of the Laurentian rocks of Canada) belonging to this order. The great geological formation known as white chalk is largely composed of foraminiferous shells, while another remarkable formation known as Nummulitic Limestone receives its name from the presence of large coin-shaped foraminifers, generally about as large as a shilling. thread-like processes, called pseudopodia,

Force (förs), n. [Fr.; L.L. forcia, fortia, from L. fortis, strong.] 1. In physics, that which is the source of all the active phenomena occurring in the material world, and of which motion, gravitation, heat, light, electricity and magnetism, cohesion, chemical affinity, are believed to be exhibitions; that which produces or tends to produce change; energy; as, the conservation of force.—2. Any one of the various modes or conditions under which force exhibits itself, as motion, heat, light, &c.; as, the correlation of forces.

The transformation and equivalence of forces is

The transformation and equivalence of forces is seen by men of science to hold not only throughout all inorganic actions but throughout all organic actions but throughout all organic actions; even mental changes are recognized as the correlatives of cerebral changes which also conform to this principle; and there must be admitted the corollary that all actions going on in a society are more activated to the construction of the construction of the conformation of

sequent actions arise.

Strength; active power; vigour; might; energy that may be exerted; as, by the force of the muscles we raise a weight, or resist an assault; the force of the mind, will, or understanding.—4. Momentum; the quantity of energy or power exerted by a moving body; as, the force of a cannon-ball; the force of the wind or waves.—5. Violence; power exerted against will or convent, conventions. exerted against will or consent; compulsory power; coercion.

Who overcomes By force hath overcome but half his foe. 6. Moral power to convince the mind; influence; moral compulsion; as, there is great force in an argument.

The government and the priests could at any time affirm to the people that certain things must be done or submitted to by force of the demunciations or counsels which those secret volumes contained. Hallam.

seis which mose secret voinnes contained. Finance, Validity; power to bind or hold; as, if the conditions of a covenant are not fulfilled, the contract is of no force; a testament is of force after the testator is dead.—8. Strength or power for war; armament; troops; an army or navy; as, a military or naval forces: sometimes in the plural; as, military forces. Hence—9. A body of men prepared for action testher wars are action force. Hence—9. A body of men prepared for action in other ways; as, a police force.—10. In law, any unlawful violence to person or property. This is simple, when no other crime attends it, as the entering into another 's possession without committing any other unlawful act. It is compound when some other violence or unlawful act is committed. Force is implied in every case of trespass, disseisin, or rescue.—Of force, of necessity; necessarily; unavoidably. [Rare.]

Good reasons must, of force, give place to better.

Good reasons must, of force, give place to better.

—No force, † no matter.—I dono force, † care not. Chaweer.—Kinetic force or energy, the force which a body actually moving can exert, at any instant of its motion, on another body resisting it, as the force with which an arm actually in motion would strike any opposing object.—Potential force or energy, the energy stored up, as it were, in a body, and which it is capable of exerting, as distinguished from kinetic energy, or that which it exerts at any moment. Hence, the potential energy of an arm is the energy residing in it when at rest, or the residue between the force actually being exerted by the arm when moving and the highest degree of force it is capable of exerting. It is thus obvious that, the higher the kinetic force, the less is the potential, and vice versa—the one force being the complement of the other.—Correlation of forces, the doctrine that force or energy can exhibit itself in various definite modes or conditions, each of which is called 'a force,' these 'forces' being mutually convertible into each other under certain conditions or circumstances. Thus motion, on being suddenly retarded or strongly resisted, becomes circumstances. Thus motion, on being suddenly retarded or strongly resisted, becomes sensible heat, or, in certain circumstances, heat and light. This is observed when a bullet strikes against a target, when a piece of iron is hammered till it is red hot, or when heat and flame are generated by rubbing two pieces of wood together. Heat, in like manner, becomes motion or motive power when it expands water into steam which lifts the piston of a steam-engine.—Conservation of force or energy, the doctrine that the total amount of force or energy in the universe is always the same, though it may change its condition or mode of exhibition. See extract.

The 'great philosophical doctrine of the present

the universe is always our same, considering the condition or mode of exhibition. See extract.

The 'great philosophical doctrine of the present era of science,' as the subject about to engage our attaction and the second of the construction of the second of the construction of the second of the construction of the construction of the second of the conservation of Energy.' The basis of the doctrine is the broad and comprehensive natural law which teaches us that the quantity of force comprised by the universe, like the quantity of force comprised to the indiverse, like the quantity of the conservation of the second of th

assumes the gaseous or vaporous form. Thus we see that the phenomena of heat are phenomena of motion, and of motion only.

Moral force, the power of acting on the reason in judging and determining. —Physical force, material influence; coercion, as by mere bodily strength.—Mechanical force, the power which produces or tends to produce motion, or an alteration in the direction of motion. Mechanical forces are of two sorts; one of a body at rest, being the same as pressure or tension; the other of a body in motion, being the same as impetus or momentum. The degree of resistance to any motion may be measured by the active force required to overcome that resistance, and hence writers on mechanics make use of the terms resisting forces and retarding forces. hence writers on mechanics make use of the terms resisting forces and retarding forces. When two forces act on a body in the same line of direction, the resulting force, or resultant as it is called, will be the sum of both forces. If they act in opposite directions, the body will remain at rest if the forces be equal; or, if the forces be unequal, it will move with a force equivalent to their difference in the direction of the greater. If the lines of direction make an angle will each other, the resultant will be a mean force in an intermediate direction.—Commostion of forces, the combining of two or more forces into one which shall have the same effect when acting in some given direction; resolution of forces, the decomposing same effect when acting in some given direction; resolution of forces, the decomposing of a single force into two or more forces, which, acting in different directions, shall be equivalent to the single force. The fundamental proposition of the composition of forces is as follows:—Any two forces acting at the same point, and represented in magnitude and direction by two straight lines, are equivalent to a third force which is represented in magnitude and direction direction direction by two straight lines, are equivalent to a third force which is represented in magnitude and direction direction direction.

presented in magnitude and direction by the diagonal of the parallelogram constructed with the two lines as its sides. Thus, let a body at A

c beacted upon by two beacted upon by two beacted upon by two forces at the same instant, one of which would cause it to move over the line AB in a given time, and the other acting alone would cause it to move over the line AG in the same time; then the direction of the potton resulting from the action of both the same time; then the direction of the motion resulting from the action of both forces will be that of the diagonal AD of the parallelogram AB DC, and at the end of the given time the body will be found at D. The diagonal AD represents the resultant of the forces in the directions AB and AC, and is equivalent to them both. By means of this proposition the resultant of any number of forces whatever may be found, and also, any given force may be resolved into two others, such that the straight lines by which they are represented from the two two others, such that the straight lines by which they are represented form the two sides of a parallelogram, of which the line representing the given force is the diagonal. The proposition is frequently termed the parallelogram of forces, and is of great importance in mechanical science. Forces have different denominations according to their nature and the manner in which they act: thus we have accelerating forces can have different denominations according to their nature and the manner in which they act; thus, we have accelerating forces, central forces, constant forces, parallel forces, custom and variable forces, &c. See these terms in their proper places.—Moving force or motive force, the same as Momentum.—Permanent force, that which acts constantly; thus, the action of a weight suspended from a cord, or resting on a surface, is a permanent force.—Impulsive force, that which is applied suddenly to a body and immediately ceases to act upon it, as the blow of a hammer or percussion.—Animal force, that which results from the muscular power of men, horses, and other animals.—Line of direction of a force, the straight line in which any force tends to make a body move. Similar forces acting on a body cause it to move in a straight line, but if the forces be dissimilar, the body will move in a curve line depending on the nature of the forces. Thus, a cannon-ball is acted on by the impulse of the charge, and by the force of gravity, and in consequence of these two dissimilar forces describes the curve of a parabola.—Polygon of forces. See Polygon.
—Unit of force, the single force in terms of which the amount of any other force is ascertained, and which is generally some known weight, as a pound.—Equilibrium of forces, the condition produced when any number of forces, which being applied to

a body, destroy one another's tendency to communicate motion to it, and thus hold it at rest.— Forces, impressed and effective. See under VIRTUAL:— External forces, those See under VIRTAL.—Exercial forces, those forces which act upon masses of matter at sensible distances, as gravitation.—Internal forces, those forces which act only on the constituent particles of matter, and at insensible distances, as cohesion.—Polar forces,

sible distances, as cohesion.—Polar forces, those forces which are conceived to act with equal intensity, in opposite directions, at the extremities of the axes of molecules, or of masses of matter, as magnetism.

Force (förs), v.t. pret. & pp. forced; ppr. forcing. 1. To compel; to constrain to do or to forbear, by the exertion of a power not resistible; as, men are forced to submit to conquerors; masters force their slaves to labour.—2. To overpower by strength.

I should have forced thee soon with other arms.

I should have forced thee soon with other arms

I should have forced thee soon with other arms.

Millon.

3. To impel; to press; to drive; to draw or push by main strength: a sense of very extensive use; as, to force along a waggon or a ship; to force away a man's arms; water forces its way through a narrow channel; a man may be forced out of his possessions.—

4. To exert to the utmost. 'Forcing my strength.' Dryden.—5. To compel by strength of evidence; as, to force conviction on the mind; to force one to acknowledge the truth of a proposition.—6. To storm; to assault and take by violence; as, to force a town or fort.—T. To ravish; to violate by force, as a female.—8. To produce or exceptions of the strength of the like; to twist, wrest, or overstrain; as, a forced tike; to twist, wrest, or overstrain; as, a forced conceit; to force an analogy.—9. To assume, or compel one's self to give utterance or expression to; as, to force a smile or a laugh; a forced show of interest.—10. To bring to maturity or to a certain stage of advance-ment before the natural period; to cause to ment before the natural period; to cause to produce ripe fruit prematurely, as a tree; to cause to grow or ripen by artificial heat, as fruits, flowers, or vegetables; hence, fig. to attempt to produce intellectual results at a premature age; as, we should not force the mental faculties of a child.—11.† To man; to strengthen by soldiers; to garrison. 12.† To have regard to; to care for.

For me I force not argument a straw, Since that my case is past the help of law. Since that my case is past the help of law. Shak.

13.† To put in force; to make binding; to enforce. 'What can the Church force more.'

J. Webster.—To force from, to wrest from; to extort.—To force out, to drive out; to compel to issue out or to leave; also, to extort.—To force wine, to fine wine by a short process, or in a short time.—To force one's (own) disnicilination of dislike. (b) To disregard one's inclination, (a) to overcome one's (own) disnicilination, or make one act contrary to his inclination,—SYN. To compel, constrain, oblige, necessitate, coerce, drive, press, impel, ravish, violate, overstrain, overtax.

3. In arith, and alg, one or more aliquot parts of a unit or whole number; any division of a whole number or unit, as \(^2\), two-fiths, done-fourth, which are called vulgar fractions. In these, the figure above the line is called the numerator, and the figure below the line the denominator. The denominator which unity or a quantity, considered as a whole, is divided, and the numerator points out how many of these parts are taken. Thus, in the fraction \(^2\), the unit or whole is divided into 4 equal parts, and 3 of them taken. A proper fraction is one whose numerator is less than its denominator. An improper fraction is one whose numerator is not less than its denominator, as \(^2\), \(^2\). An improper fraction is one whose numerator is not less than its denominator, as $\frac{\pi}{3}$, $\frac{\pi}{3}$. A simple fraction expresses one or more of the equal parts into which the unit is divided, without reference to any other fraction. A compound fraction expresses one or more of the equal parts into which another fraction or a mixed number is divided. Compound fractions have the word of interposed between the simple fractions of which they are composed; thus, $\frac{\pi}{3}$ of $\frac{\pi}{3}$ of $\frac{\pi}{3}$ is a compound fraction. A complex fraction is that which has a fraction either in its numerator or denominator, or in each of them: thus, $\frac{\pi}{3}$, $\frac{\pi}{3}$, and $\frac{\pi}{6}$ are complex fractions. Fraunhofer's Lines (froun'hō-ferz līnz), n.pl. Fraunhofer's Lines (frounhô-ferz linz), n.pl. The dark lines observed crossing a very clear solar spectrum at right angles to its length, first discovered by Wollaston, but named after Fraunhofer, a Bavarian optician who first thoroughly investigated them. They are caused by the absorption of portions of the rays emitted from the incandescent body of the sun in their passage through the gases and vapours, as those of iron, sodium, magnesium, &c., which by these lines are shown to exist in the luminous envelope of the sun, and to a much less extent in their passage through the aqueous vapour and permanent gases of the earth's atmosphere. This absorption takes place from the remarkable property possessed by gases and vapours of retaining those portions of a ray of light passing through them from an incandescent solid or liquid body, which they themselves would emit if incandescent. The discovery of these lines led to the invention and use of the spectroscope, the invention and use of the spectroscope, to the science of spectroscopy, and to all our present knowledge of solar and stellar chemistry.

Freemasonry (fré'mā-sn-ri), n. A term applied to the organization of a society calling themselves free and accepted masons, and all the mysteries therewith connected. This society, if we can reckon as one a number of societies, many of which are unconnected with each other, though they have the same origin and a great similarity in their constitution, extends over almost all the countries of Europe, many parts of America, and some other parts of the globe. According to its own peculiar language it is founded on the practice of social and moral virtue. It claims the character of charity, in the most extended sense; and brotherly love, relief, and truth are inculcated in it. Fable and imagination have traced back the origin of freemasonry to the Roman Empire, to the Pharaohs, the temple of Solomon, the tower of Babel, and even to the building of Noah's ark. In reality it took its rise in the middle ages along with other incorporated crafts. Skilled masons moved from place to place to assist in building the magnificent sacred

Friction (frik'shon), n. [Fr.; L. frictio, from
frico, frictum, to rub, to rub down.] 1. The
act of rubbing the surface of one body
against that of another; attrition; as, many
bodies by friction emit light, and friction generates or evolves heat.—2. In
mech. the effect of rubbing, or the resistance which a moving body meets with
from the surface on which it moves. Friction arises from the roughness of the surface of the body moved on and that of the
moving body. No such thing can be found
as perfect smoothness of surface in bodies.
In every case there is, to a less or greater
extent, a roughness or unevenness of the
parts of the surface, arising from peculiar
texture, porosity, and other causes, and parts of the surface, arising from peculiar texture, porosity, and other causes, and therefore when two surfaces come together the prominent parts of the one fall into the cavities of the other. This tends to prevent or retard motion, for in dragging the one body over the other an exertion must be used to lift the prominences over the parts which oppose them.—Coefficient of friction. The coefficient of friction for any two surfaces is the ratio that subsists between the force necessary to move one of these surfaces horizontally over the other, and the pressure between the two surfaces. Thus the coefficient of friction for oak and cast-iron is 83:100, or 38.

coefficient of friction for oak and cast-iron is 38: 100, or 38.

Friction (frik/shon), a. Implying or relating to friction; frictional. R. Adams.

Frictional (frik/shon-al) a. Relating to friction; moved by friction; produced by friction; moved by friction; produced by friction; as, Frictional electricity.—Frictional gearing-wheels, wheels which cathor bite, and produce motion not by teeth but by means of friction. With the view of increasing or diminishing the friction the faces are made more or less V-shaped.

Friction-balls (frik/shon-balls), n. pl. Balls placed under a heavy object to reduce the friction, while that object is moving horizontally. Some forms of swing-bridges have such balls placed under them.

Friction-clutten (frik/shon-kluch), n. In

have such balls placed under them.

Friction-clutch (frik/shon-kluch), n. In mach, a species of loose coupling much used for connecting machines which require to be frequently engaged and disengaged, as wash-stocks, or which are subject to sudden variations of resistance, as crushing-rollers. In the figure it is shown in section; a is the shaft through which the moving power is conveyed, on which is a loose wheel b, intended to communicate motion to the gearing of the machine to be driven. On the eye of this wheel is keyed an external cone, and to this another external cone d, loose on the shaft longitudinally, is accurately fitted. But this cone, while it is free to move endlong on the shaft by means of an ordinary shifting lever, the fork of which is received into the

recess f, is pre-vented from turning round on the shaft by the fea-thers marked e. When the extern-al cone is thrown forward, so that it embraces the

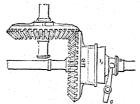

Friction-clutch

at embraces the surface of the cone c, the friction gradually puts the wheel b in motion, and being kept in contact by means of a spring or weight on the shifting lever the friction is usually sufficient to transmit the amount of power sufficient to transmit the amount of power necessary for the attached machinery. But if by any chance the load should suddenly increase, so as to exceed the friction, the cones slip on each other, and the velocity of the wheel b is consequently diminished, or the resistance may become so great that the wheel b will be brought to rest. In this way the risk of breakage in ordinary working, and the shocks which would otherwise be thrown on the general gearing by the sudden engagement of a heavy machine, are very much lessened.

are very much lessened.

Friction-comes (frik'shon-könz), n. pl. In mach. a form of slip-coupling, consisting of two cones a b, of which the one a is formed on the back of the driving-wheel, loose on the driving-shaft, and the other b forms part of a sliding-block, attached to the shaft by a sunk feather, and fits accurately into the interior of that formed on the back of the wheel. The sliding-block can be thrown in and out of gear in the ordinary way, by means of a fork c, and the transmission of motion depends on the friction of the two conical surfaces. If the load on

the machine, which is driven by the second shaft, is suddenly changed, the adhesion

Friction-cones

between the surfaces of the cones allows them to slip, and thus breakage is avoided. Friction-coupling (frik'shon-kup'ling), n. In much. a form of coupling in which two shafts are connected by friction, as in the friction, all the and frinction cones.

friction-clutch and friction-cones.

Friction-gear (frik'shon-ger), n. Same as Frictional Gearing-wheels (which see under FRICTIONAL).

Friction-hammer (frik'shon-ham-mer), n. A hammer lifted by the friction of revolving

Frictionless (frik'shon-les), a. Having no

friction.

Friction-powder (frik'shon-pou-der), n. A composition of chlorate of potash and antimony, which readily ignites by friction.

Friction-rollers (frik'shon-rol-ers), n. pl. A name common to any small rollers or cylinders employed to convert sliding motion into rolling motion. Such cylinders are often placed under heavy bodies when they are required to be moved any short distance on the surface of the ground; and, in mach., the same method is occasionally employed to diminish the friction of a heavily-loaded axis. In that case a number of small cylinders are inclosed round the of small cylinders are inclosed round the axis, and partake of its motion.

Friction-tube (frik'shon-tüb), n. Milit, a tube used in firing cannon, sufficient heat being generated in it by friction to ignite friction-powder

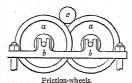

friction-powder.

Friction-wheel (frik'shon-whël), n. In mach. (a) a form of slip-coupling applied in cases where the variations of load are sudden and great, as in dredging-machinery, &c. It consists of a strong plain pulley B, keyed on the driving-shatt; and on the circumference of this a wheel A is fitted, with a series of friction-plates a a a interposed, and retained in recesses formed in the eye

Friction-wheel.

of the wheel. Behind each of those plates a set-screw b is inserted, which bears against the back of the plate, and can be tightened at pleasure to regulate the degree of friction required for the ordinary work; but should the pressure on the circumference of the wheel A exceed this, the plates slide upon the circumference of the pulley B, which continues to revolve with the shaft, and the wheel itself remains stationary. (b) One of two simple wheels or cylinders in-

tended to assist in diminishing the fric-tion of a horizontal axis. The wheels tion of

are simply plain cylinders a a, carried on parallel and independent axes b b. They are disposed so as to overlap pair and pair at each end of the main axis c, which rests in the angles thus formed by the circumferences. The axis, instead of slidings on a fixed surface, as in ordinary cases, carries round the circumferences of the wheels on which it is supported with the same velocity as it possesses itself, and in consequence the friction of the system is proportionally lessened.

—Society of Friends, the name assumed by the society of dissenters commonly called Quakers, which took its rise in England about the middle of the seventeenth century through the preaching of George Fox. Upon doctrinal points the Friends profess to maintain the doctrines generally received by Protestants but they reject all sacrato maintain the doctrines generally received by Protestants, but they reject all sacraments, and do not appoint an order of ministers, considering that the instruction of their congregations may be undertaken from time to time by persons of either sex who may feel prompted by the Holy Spirit to speak. The Friends are characterized by plainness in dress, by their adherence to the use of the pronouns thou and thee when addressing one person, and the disuse of the customary salutations and tokens of obeisance, by their refusal to take judicial oaths, their objection to balls and theatres, to the reading of novels, to indulging in to the reading of novels, to indulging in music, especially sacred music, and by certain other features.—To be friends with, to be in a relation of friendship with.

G.

G, the seventh letter in the English alphabet. If we bend the tongue so as to form an arch, which presses against the hinder part of the roof of the mouth, and produce a sound by lowering the tongue, and giving utterance to voice, the sound is called in English g hard, which is a guttural mute, the 'voiced' or soft or sonant sound corresponding to the 'breathed' or hard or surd sound k (or c hard). This sound of g is what the letter always has before a (except in gaol), o, u, and when initial also before e and it in all words of English origin, and when final. The soft sound of g, or that which it more commonly has before e, i, and y, as in gem, gin, gymnustics, is a palatal sound the same as that of j, and did not occur in the oldest English or Anglo-Saxon. It is the voiced sound corresponding to the breathed sound ci, as in church. The letter G was a Roman invention introduced in comparatively late times; it was formed from C, which previously had been doing double duty as the representative of both the sound of k and that of g (as in give). G is silent before n at the beginning of words, as gnat, gnaw; in the middle of words before n it is generally pronounced; at the end, though not pronounced it has the effect of lengthening the preceding vowel, as in benign, condign, malign, campaign. In a number of words which in Anglo-Saxon contained a guttural h, it has intruded itself before the h, forming a combination which now merely lengthens the preceding vowel sound, as in fought, bought, bright, might, might, night, night, night, high, The Anglo-Saxon g seems often to have had a sound nearly equivalent to our y, and in many English words has been softened into y or w, or in other ways; is, A. Sax, gear, E. year; A. Sax, bygen, E. baw; A. Sax, gear, E. way; A. Sax, bygen, E. law; A. Sax, segie, E. saw. [Fr. galaxie, from Gr. galaxias (lepklos, circle, being understood), from gala, galaktos, milk. Akin L. lac, lactis, nilk.] I. In astron. (a) the Milky Way; that long, white, luminous track which is seen at night stretching across the heavens from horizon to horizon, and which, when fully traced, is found to encompass the heavenly sphere like a girdle. This luminous appearance is occasioned by a multitude of stars so distant and blended as to be distinguishable only by the most powerful telescopes. At one part of its course it divides into two great branches, which remain apart for a distance of 150° and then reunite; there are also many other smaller branches that it gives off. At one point it spreads out very widely, exhibiting a fanilke expanse of interlacing branches nearly 20° broad; this terminates abruptly and leaves here a kind of gap. At several points are seen dark spots in the midst of some of the brightest portions; one of the most easily distinguished of these dark spots has long been known as the 'coal-sack'. (b) A remote cluster of stars.—2. An assemblage of splendid persons or things. did persons or things.

Galilea (ga'li-le), n. [Named after the scriptural Galilea of the Gentiles. See definition.] A portico or chapel annexed to a church, used for various purposes. In it public penitents were stationed, dead bodies deposited previously to their interment, and religious processions formed; and it was only in the galilee that in certain religious houses the female relatives of the monks were allowed to converse with them, or even to attend divine service. When a female made an application to see a monk she was directed to the porch, usually at the western extremity of the church, in the words of Scripture, 'He goeth before you into Galilee; there shall you see him.' The only English buildings to which the term galilee is applied are those attached to the cathedrals of Durham, Ely, and Lincoln. The galilee at Lincoln Cathedral is a porch on the west side of the south transept; at Ely Cathedral it is a porch at the west end of the nave, built chiefy for the use of the women, who were not allowed to advance further than the second pillar of the nave. This last was also used as the bishop's consistory court.

About 160 species are described, sixteen of which are found in Britain; the remainder are mostly natives of Europe, one or two, as G. Aparine, occurring as weeds of cultivation in all parts of the world. G. verum (the ladies' bed-straw) was formerly used in Cheshire to coagulate milk; it is still employed for the same purpose by the Highlanders of Scotland, along with the leaves of the stinging nettle and a little salt. G. Aparine is a common plant in hedges and on waste ground, and is popularly known as clivers or cleavers, a name derived from the circumstance of its seed-vessels, or burs, cleaving by means of their hooked prickles to the dress of persons coming in contact with them, and as goose-grass from the avidity with which the young stems and leaves are eaten by geese. The seeds have been recommended as a substitute for coffee.

the Quercus infectoria, a species of oak, abundant in Asia Minor, Syria, Persia, &c. When the maggot is hatched it produces a morbid excrescence of the surrounding parts. Galls are inodorous, and have a nauseously bitter and astringent taste. They are nearly spherical, and vary in magnitude from the size of a pea to that of a hazel-nut. When good, they are of a black or deep olive colour. They are also termed Nut.galls or Gall-muts, and are known in commerce by the names of white, green, and blue. The two latter kinds are the best. The chief products of galls are tanuin and gallic acid. Call-nuts are very extensively used in dyeing and in the manufacture of ink. They are the most powerful of all the vegetable astringents, and are frequently used in medicine. They are chiefly imported from Aleppo, Tripoli, Smyrna, and Said. Galls are also produced, though of inferior quality, on the other species of oak, and likewise on plants and trees of different kinds, as berry-galls, apple-galls, &c. These galls are of various forms and sizes.

Galvanic (gal-van'ik), a. [See GALVANISM.]

Pertaining to galvanism; containing or exhibiting it, as galvanic action, galvanic influence.—Galvanic electricity, electricity arising from chemical action. See GALVANISM.—Galvanic battery, an association of galvanic pairs for the production of

Simple Galvanic Battery

current electricity. The simplest form of battery consists of a number of pairs of copper and zine plates immersed in ditute sulphuric acid, the successive pairs being joined together by wires, the copper of the first cell to the zinc of the second, the copper of the second to the zinc of the third, and so on. (See GALVANISM.) This and similar forms of battery are objectionable partly on chemical and partly on electrical grounds. As the chemical action goes on, the liquid decreases in strength, acting less powerfully on the zinc, while at the same time the zinc which has been dissolved is deposited on the copper, thus tending to assimilate the plates, and so destroy the current, which depends essentially upon the plates retaining their distinctive metallic characteristics. But the most important cause of weakening in such batteries consists in polarization of the plates, that is, in the deposition on the surface of the copper of a film of hydrogen, which not only interposes resistance by its defective conductivity, but also brings to bear an electromotive force in a direction opposed to that of the current. Various batteries have been devised to overcome these obstacles to the maintenance of a constant current is the devised to overcome these obstacles to the maintenance of a constant current, as the Daniell battery, the Grove, the Bunsen, and the Menotti. One of the best of these is the Daniell, invented in 1836. The cell of this battery consists of copper and zinc, the copper being in the form of a jar and serving as the outer dish of the cell. The zinc is formed into a rod and is placed inside a porous jar of unglazed porcelain, which again stands inside the copper jar. In the porous dish dilute sulphuric acid serves to excite the zinc, while as a conducting and absorbent liquid, between the porous vessel and the copper, is put a strong solution of sulphate of copper or blue vitriol. For the purpose of keeping it saturated, which is essential, crystals of sulphate of copper are devised to overcome these obstacles to the

suspended in it near the surface by means of a wire-basket of copper. The effect of this arrangement is that the hydrogen is intercepted before it can arrive at the copof a wire-basket of copper. The effect of this arrangement is that the hydrogen is intercepted before it can arrive at the copper, and the deposit which takes place on the copper is a deposit of copper, the hydrogen taking the place of this copper in the saturated solution. The cells thus constructed are usually arranged in square compartments in a wooden box. A modification of the Daniell battery in which the wooden trough is divided into cells by glass plates or varnished slate slabs, which are again subdivided by porous earthenware, zinc plates and dilute acid being placed in one subdivision, copper and its sulphate in the other, is also in use. The Grove battery somewhat resembles the Daniell, but has a greater electro-motive power, the plates being plathnum and zinc. It is inferior, however, in constancy. The Bunsen battery, the one in use for the telegraphs in Germany, differs in principle from Grove's only in the use of a carbon or charcoal electrode for a platinum one. The Menotti is a Daniell battery with the porous jar replaced by a layer of wet sawdust or sand. Sir W. Thomson has invented a form of battery, consisting of a square wooden tray, lined with lead, at the four corners of which four blooks of wood are placed to support the zinc, which is cast with bars like a griddron instead of being a solid plate. On the bottom of the tray a copper plate is laid, which forms the positive pole of the battery. The liquid employed is a solution of sulphate of zinc, and crystals of sulphate of copper are dropped on to the bottom of the cell round the edges. Instead of the porous earthenware jar of the Daniell, the zinc is protected from the sulphate of copper by having very strong thick paper tied round it. This,

Section of Sir William Thomson's Battery.

while it allows perfectly free electrical communication between the two plates, hinders the sulphate of copper in the solution from being carried up to the zine by currents of the liquid. This battery is used at all the telegraph stations at which Sir W. Thomson's siphon-recorder is employed.

Galvanical (gal-van'ik-al), a. Galvanic.

The phenomena of magnets, of electrical bodies of galvanical apparatus, seem to form obvious material for such sciences.

Whewell.

The phenomena of magnets, of electrical bodies, of gadzenized apparatus, seem to form obvious material for such sciences.

Galvanism (galvan-izm), n. [From Galvani, professor of anatomy at Bologna, 1790, the first investigator in this field.] That branch of the science of electricity which treats of the electric currents arising from chemical action, more particularly from that accompanying the decomposition of metals. If a plate of copper and a plate of amalgamated zinc are placed in a vessel containing water and a small quantity of sulphuric acid, so long as the plates are kept separate no apparent action takes place, but whenever they are brought into contact bubbles of hydrogen gas appear at the copper plate and continue to be formed so long as the plates are kept touching. If weighed after being for some time in contact, the copper plate is found to be unaffected, the zinc plate is found to be unaffected, the zinc plate to have lost in weight, and the liquid to hold in solution the lost zinc in the form of the sulphate of that metal. If wires of copper or any other conductor of electricity be attached to the plates, and their free ends be made to touch, the changes mentioned take place just as if the plates themselves were in contact. If a portion of the wires thus joined is placed parallel to a magnetic needle, the austral or north-seeking end of the needle no longer points to the magnetic north but to a point either to the west or east of it, and all the abovementioned phenomena, though in a less degree, occur even when the wires, instead of being in contact, are merely placed in a liquid, the liquid completing the contact. When so immersed the ends of the wires show strong chemical affinities; thus, if the conducting liquid be a solution of the sulphate of copper, the wire from the zinc plate becomes coated with the copper of the solution, while the other wire structs its oxygen and sulphuric acid,

wasting away by entering into combination with them. Again, if the ends of the wire be connected by a small piece of platinum or iron wire, the passage of the electric current through the wire makes it red hot. The wires connecting the plates are found, therefore, when in actual or virtual contact, to possess magnetic, chemical, and heating properties. Such an arrangement of plates as the above, together with the exciting liquid, is called a galvanic pair, or galvanic call, and a combination of such pairs or cells forms a galvanic pair through which an electric current is passing forms a complete chain or circuit; thus, in the above arrangement of plates the current may be supposed to start from the zinc, pass through the liquid to the copper, and thence through the wire back to the zinc. When the copper and zinc plates are connected by the wire the circuit is said to be closed, the current then circulating; when the connection between the plates is not complete the circuit; said to be broken or interrupted. When the circuit is said to be broken or interrupted. When the circuit; when it includes only a single cell, like the above, it is called a simple galvanic circuit; when it includes only a single cell, like the above, it is called a simple galvanic circuit. The copper plate in the above arrangement, or the chemically passive plate or extremity, in any arrangement or battery, is called the positive pole of the cell or battery, and the zinc or chemically active plate or extremity, the negative pole. See the above figure of Volta's pile or battery, which consists of a number of compound plates of copper and zinc separated by circular pieces of wet cloth—a zinc plate at bottom, copper at top. Galvanic electricity is a most important agent in the arts, in medicine, surgery, &c., and it was only through its discovery that the invention of the electric telegraph became possible. (See Telegraph.) Galvanic electricity, in contradistinction to frictional electricity, which is called statical, from its being concerned in which electricity remains insulated or stationary. Galvanography (gal-van-ogra-fi), n. [E. galvanism, and Gr. grapho, to write.] A

method of producing plates for copperplate engraving by the galvanoplastic process without etching. The drawing is made exactly as it is to appear upon paper either by means of a thickish pigment on a polished silver plate or copper plate coated with silver, or by means of chalk on a roughened copper plate, so that the painted or chalked portions form a slightly raised surface. A deposit of copper is then made on the plate in the ordinary way, and a copper plate is thus produced forming an exact reverse of the other, the raised portions of which now appear depressed. The impressions are taken from this in the same manner as in copperplate printing.

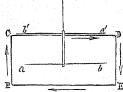

Galvanology (gal-van-ol'o-ji), n. A description of the phenomena of galvanism.

Galvanometer (gal-van-om'et-er), n. [Galvanometer (gal-van-om'et-er), n. [Galvanometer (gal-van-om'et-er), n. [Galvanometer continuing the existence and determining the strength and direction of an electric current. In all galvanometers the principle of the action is the same. It depends upon the force which Cersted discovered to be exerted between a magnetic needle and a wire carrying a current—a force which tends to set the needle at right angles to the direction of the current, and whose intensity, other things remaining the same, depends directly upon the strength of the current. The sine galvanometer consists of a magnetic needle poised at the centre of a coil of insulated copper-wire, wound round a vertical circle that may be turned horizontally on its stand. If the needle and vertical circle are both in the magnetic needle is deflected, the strength of the current being as the sine of the angular deviation. The astatic galvanometer consists of a pair of similar needles magnetized, with their poles turned.

of similar needles magnetized, with

of similar needles magnetized, with their poles turned opposite ways, and stiffly connected at their centres, so that both will swing together. The one tends always to turn in a direction opposite to the other under the earth's magnetic attraction, so that, if the needles were perfectly alike, we should have a perfectly astatic pair, or a pair that would not tend to assume any particular direction from the magnetic influence of the earth. One of the needles, ab, is nearly in the centre of the coil CDFF through which the current passes; the other, a'b', just above the coil. When a current traverses the coil in the direction of the arrows the action of all parts of the current upon the lower needle tends to urge the austral pole a towards the back of the figure and the boreal pole b to the front, while the upperneedle, a'b', is affected

principally by the current CD of the coil principally by the current of of the coin which urges the austral pole a' to the front of the figure and the boreal pole b' to the back. Both needles are thus urged to rotate in the same direction by the current, and as the opposing action of the earth is greatly enfeebled by the combination a much larger deflection is obtained than would be given by one of the needles if employed alone. In the tangent galvanometer a very short magnetic needle is delicately suspended so as to turn in a horizontal plane. The point about which it turns is at the centre of a vertical coil of copper-wire through which the current is passed. The diameter of the coil is at least

ten or twelve times the length of the needle. ten or twelve times the tength of the heedite.
The needle is therefore usually not more than
I inch long; and, for convenience of reading its
deflections, long light pointers of aluminium
or of glass fibre are comented to its ends. To or of glass fibre are cemented to its ends. To use the instrument it is placed so that the vertical coil of copper-wire is in the plane of the magnetic meridian. The current is then sent through the coil, and the angle by which the needle is deflected is read off. It is easy to show that under these circumstances the strength of the current is proportional to the tangent of the angle of deflection, whence the name of the instrument. Thomson's mirror colors were the intervent is the worst sensitive or large name of the instrument. Thomson's mirror galvanometer'is the most sensitive galvanometer yet invented. Its needle, which is very short, is rigidly attached to a small light concave mirror, and suspended in the centre of a vertical coil of very small diameter by a silk fibre. A movable magnet is provided for bringing the needle into the plane of the coil when the latter does not coincide with the magnetic meridian. Needle, mirror, and magnet weigh only about 1½ grain. At a distance of 2 or 3 feet from the mirror is a solid wooden stand, with a graduated scale, facing the of 2 or 3 feet from the mirror is a solid wooden stand, with a graduated scale, facing the mirror. In the stand, just under the centre of the scale, a hole is cut, and a fine wire stretched upright across it. A strong lamp stands behind the opening so that its light will fall on the mirror and be reflected back on the scale. An image of the wire will thus be constantly thrown on the scale, and the slightest motion of the needle and its mirror will produce a much greater patien of this will produce a much greater motion of this image. As the current flows the one way or the other the index will move to one side or the other. This galvanometer was invented for use on the Atlantic submarine cables. It was use on the Atlantic submarine cables. It was long the only instrument with which signals could be read through long submarine lines; and it is still employed to a great extent, though being superseded by the siphon-recorder of the same inventor.

Garangan (gar'an-gan), n. A Javanese species of ichneumon, the Herpestes javanicus. It is about the size of a large waterat, and abounds in the teak forests, preying rat, and abounds in the teak forests, preying on snakes, birds, and small quadrupeds. The natives assort that, when it attacks a snake, it puffs up its body and induces the snake to twine itself round its inflated person. It then suddenly contracts itself, slips from the reptile's coils, and darts upon its neck. There is some foundation for this assertion in the fact that the garangan does possess the power of inflating and contracting its body with great rapidity. The hadge of the highest order of knighthood in Great Britain, called the order of the Garter; hence, also, the order itself. This order is one of the most illus-

the most illus-trious of the military orders of knighthood in Europe. It is said to have been founded by Edward III. in memory of the following circumstance. The Countess of Salisbury having dropped her garter while dancing, the king pick-ed it up and tied it round his own leg; but, observing the jealous glances of the queen, he re-stored it to its owner with the exclamation: Honi soit qui mal y pense (Shamed be he

(Shamed be not who thinks evil of it). The peculiar emblem of the order is a dark blue ribbon, edged with gold, bearing the motto, and with a buckle and pendant of gold (fig. 5). It is worn on the left leg below the knee. The mantle is of blue velvet, lined with white taffeta; the hood and surcoat are of crimson velvet, and the hat is of black velvet with a plume of white ostrich feathers, with a tuft of black heron's feathers in the centre. or orack nervor steamers in the centre. The collar of gold (fig. 3) consists alternately of garters surrounding roses and of double knots; and the badge of the order (fig. 4), consisting of a figure of St. George on horseback knots; and the badge of the order (fig. 4), consisting of a figure of St. George on horseback fighting the dragon, depends from it. The lesser George (fig. 2) is worn on a broad blue ribbon over the left shoulder. The star (fig. 1), formerly only a cross, is of silver, and consists of eight points, with the cross of St. George in the centre, encircled by the garter. Until the reign of Edward VI. the title of the order was the Order of St. George, which name it is still known by. The original number of knights was twenty-six, and this is still the nominal number, although the princes of the blood are admitted as supernumerary members.—3. A king-of-arms, instituted by Henry V. for the service of the order of the Garter. His duties are to attend upon the knights at their solemnities, to intimate their election, to call them to be installed at Windsor, to cause their arms to be suspended above their stalls, to marshal their funeral processions, &c. He is also principal king-of-arms in England, and as such grants and confirms arms under the authority of the earl-marshal, to whom, however, he is not subject as garter-king-of-arms.—4. [Fr. gaz, a word formed by Van Helmont to signify, in general, a spirit not capable of being coagulated: probably in connection with D. geest, spirit, A. Sax. gust, G. gets.] 1. In chem. an elastic aeriform fluid, a term originally synonymous with air, but afterwards restricted to such bodies as were supposed to be incapable of being air, but afterwards restricted to such bodies as were supposed to be incapable of being reduced to a liquid or solid state. Under this supposition gas was defined to be 'a term applied to all permanently elastic fluids or airs differing from common air.' Since the liquefaction of gases by Faraday, effected by combining the condensing powers of mechanical compression with that of very considerable depression of temperature, the distinction between gas and vapour, viz. that the latter could be reduced to a liquid or solid condition by reduction of temperature and increase of pressure, while gas could not be so altered, is no longer tenable, so that the term has resumed nearly its original signification, and designates any subginal signification, and designates any sub-stance in an elastic aeriform state. Gas may now be defined to be a substance pos-sessing the condition of perfect fluid elassessing the condition of perfect into enasteriteity, and presenting, under a constant pressure, a uniform state of expansion for equal increments of temperature, being distinguished by this last property from vapour, which does not present such a rate of uniform expansion. Gases are distinguished from liquids by the name of clastic fluids; while liquids ore termed non-lastic fluids. innom expansion. Gases are disabilitation to liquids by the name of clastic fluids; while liquids are termed non-clastic, because they have, comparatively, no elasticity. But the most prominent distinction is the following:—Liquids are compressible to a certain degree, and expand into their former state when the pressure is removed; and in so far they are elastic, but gases appear to be in a continued state of compression, for when left unconfined they expand in every direction to an extent which has not hitherto been determined. Gases retain their elasticity in all ordinary temperatures, and in this they differ from vapours. The number of gaseous bodies is great, and they differ greatly in their chemical properties. They are all, however, susceptible of forming combinations with fluid and solid substances. Many of them are of great importance in the arts and manufactures, and one, viz. coalcase has contributed impressely to the exception. arts and manufactures, and one, viz. coal-gas, has contributed immensely to the comgas, has contributed immensely to the com-fort and convenience of our cities and towns. Gases are invisible except when coloured, which happens in two or three instances. 2. In popular lan, coal-gas (which see), the common gas used for illuminating purposes. Gas (gas), v.t. combustion of coal-gas; a gas-jet.

Gas-main (gas/mān), n. One of the principal pipes which convey the gas from the
gasworks to the places where it is to be con-

Gas-meter (gas mēt-er), n. An instrument through which the gas is made to pass, in order to ascertain the number of cubic feet which are consumed in a given time at a particular place. Of this instrument there are two classes, the wet and the dry. The wet meter is composed of an outer box about three-fifths filled with water. Within this is a revolving four-chambered drum, each is a revolving four-chambered drum, each chamber being capable of containing a definite quantity of gas, which is admitted through a pipe in the centre of the meter, and, owing to the arrangement of the partitions of the chambers, causes the drum to maintain a constant revolution. This sets in motion a train of wheels carrying the hands over the dials which mark the quantity of gas consumed. The dry meter consists of two or three chambers, each divided by a flexible partition or diaphraem by the sists of two or three chambers, each divided by a flexible partition or diaphragm, by the motion of which the capacity on one side is diminished while that on the other is increased. By means of slide-valves, like those of a steam-engine, worked by the movement of the diaphragms, the gas to be measured passes alternately in and out of each space. The contractions and expansions set in motion the clockwork which each space. The contractions and expansions set in motion the clockwork which marks the rate of consumption. The dia-phragms in all the chambers are so connected

that they move in concert.

Gasometer (gaz-om'et-en), n. [Gas, and Gr.
metron, a measure,] 1. In chem. (a) an instrument or apparatus intended to measure, collect, preserve, or mix different gases

(b) An instrument for measuring the quantity of gas employed in any chemical experiment.—2. A reservoir or storehouse for gas, especially for the ordinary illuminating gas produced in gas-works, and which supplies

Gasometric (gaz-o-met'rik), n. Of or pertaining to gasometry or the measurement of gases.—Gasometric analysis, in chem. the process of separating and estimating the relative proportions of the constituents of a gaseous body. This is effected either by the action of absorbents, as on gas contained in a eudiometer (which see), or by exploding the gas with oxygen and observing the vol-umes before and after explosion. Gasometry (gaz-om'et-ri), n. The science, art, or practice of measuring gases; that de-

art, or practice of measuring gases; that de-partment of chemical science which treats of the nature and properties of gases. Gasoscope (ga'zō-skōp), n. [Gas, and Gr. skopeō, to see.] An instrument for indicat-ing the pressure of gas in buildings, mines,

Ing the pressure of gas in buttange, many, or other places.

Gasp (gasp), v.i. [Icel. geispa, to yawn; Dangispe, to gasp; L.G. japen, japsen, the former of which recalls the E. gape.] 1. To oper the mouth wide in laborious respiration; to labour for breath; to respire convulsively; to pant violently.

She gasps and struggles hard for life. Lloyd. 2. To pant with eagerness; to crave vehemently. 'Quenching the gasping furrows thirst for rain.' Spenser.—To gasp after, to

vehemently long for.

The Castilian seeing how dearly they loved one another, and gasped after liberty, demanded a most exorbitant price for their ranson.

Gelatine, Gelatin (jelatin), n. [Fr. gilatine, it and Sp. gelatina, from L. gelo, to congeal, to freeze, gelu, ice.] A concrete animal substance, transparent, and soluble slowly in cold water, but rapidly in warm water. It is confined to the solid parts of the holdy such as tendons licements car. water. It is comment to the sold parts of the body, such as tendons, ligaments, car-tilages, and bones, and exists nearly pure in the skin, but it is not contained in any healthy animal fluid. Its leading character is the formation of a tremulous jelly when its solution in boiling water cools. Gelatine does not exist as such in the animal tissues, does not exist as such in the animal tissues, but is formed by the action of boiling water. The coarser forms of gelatine from hoofs, hides, &c., are called glue; that from skin and finer membranes is called size; and the purest gelatine, from the air-bladders and other membranes of fish, is called isingless. With tannin a yellowish white precipitate is thrown down from a solution of gelatine, which forms an election discrepance and the state of the state with tamm a yenowars white prespirate is thrown down from a solution of gelatine, which forms an elastic adhesive mass, not unlike vegetable gluten, and is a compound of tannin and gelatine. It is this action of tannin an gelatine that is the foundation of the art of tanning leather. Gelatine when acted upon by sulphuric acid yields gelatine sugar or glycocoll. When treated with potash it is said to yield glycocoll and lencine. Gelatine is nearly related to the proteids. No chemical formula has yet been deduced for gelatine. It is a nutritious article of food, and as part of the diet in hospitals produces the best effects, but animals fed exclusively on it die with the symptoms of starvation, as it cannot yield albumen, fibrine, or caseine. Its ultimate components are 47 8 carbon, 79 hydrogen, 16 9 nitrogen, 274 oxygen. See Jelly.—2. See Gellatines (1800 till) of the control of the street of the control of t

sex, male or female.—3. In gram. one of those classes or categories into which words are divided according to the sex, natural or metaphorical, of the beings or things they denote; a class of words marked by similarity in termination, the termination having attached to it a distinction in sex, as seen in the termination in nouns, adjectives, participles, &c.; a grammatical category in which words of similar termination are classed together; such a distinction in words. classed together; such a distribution in words. In English words expressing males are said to be of the masculine gender; those expressing females, of the feminine gender; and words expressing things having no sex, are of the neuter or neither gender.

Gender is a grammatical distinction and applies to yords only. Sex is a natural distinction and applies of wing objects.

Dr. Morris. words only. Sex to living objects.

words only, Jose is a many control to fiving objects.

Gender has two aspects; (1) it represents a tendency to use different sounds for relations to males from those used for relations to females, or to inanimate things; (a) it represents the tendency to couple together words (nouns, adjectives, and pronouns) agreeing in their terminations. From the first point of view there are but three genders; many languages have but two; some have none. From the second point of view there may be as many genders as there are sets of terminations; some languages have none; some, e.g. the Congoes and Caffirs, have many.

extract.

The Latin genitivus is a mere blunder, for the Greek word genité could never mean genitivus. Genité in Greek had a much vider, a much more philosophical meaning. It meant casus generalis, the general case, or rather the case which expresses the genus or kind. This is the real power of the genitive. It I say, a bird of the water, of the water defines the genus to which a certain bird belongs; it refers to the genus of water birds. Man of the mountains means a mountaineer. In phrases such as 'son of the father' or father of the son,' the genitives have the same effect. They predicate something of the son or of the father and the sons of the mother the sons of the father and the class or genus to which the sons respectively belonged.

'Genius, Wisdom, Abilities, Talents, Parts, Ingenuity, Capacity,' Cleverness. 'Genius is the power of new combination, and may be shown in a campaign, a plan of policy, a steam-engine, a system of philosophy, or an epic poem. It seems to require seriousness and some dignity in the purpose. . . In weaving together the parts of an argument, or the incidents of a tale, it receives the inferior name of at agenuity. Wisdom is the habitual employment of a patient and comprehensive understanding in combining various and remote means to promote the happiness of mankind. . . Abilities may be exerted in conduct or in the arts and sciences, but rather in the former. . . Talents are the power of executing well a conception, either original or adopted. . . Parts have losts a considerable portion of their dignity. They were used in the last century perhaps almost in the sense in which we now rather employ talents. . . Capacity is a power of acquiring. It is most remarkable in the different men acquire a language. 'Sir J. Mackintosh. ing. It is most remarkable in the different degrees of facility with which different men acquire a language. Sir J. Mackintosh. To the above it may be added that properly capacity is passive power, or the power of receiving, while ability is active power, or the power of doing. The species are for the most part found on the vater.

Geocronite (jē-ok'ron-it), n. [Gr. gē, the earth, and Kronos, Saturn, the alchemistic

water.

Geocronite (jē-ok'ron-īt), n. [Gr. gē, the earth, and Kronos, Saturn, the alchemistic name of lead.] A lead-gray ore with a metallic lustre, consisting of antimony, lead, sulphur, and a little arsenic.

Geocyclic (jē-ō-sik'lik), a. [Gr. gē, the earth, and kyktos, a circle.] 1. Of or pertaining to the revolutions of the earth.—2. Circling the earth periodically.—Geocyclic machine, a machine intended to represent in what manner the changes of the seasons, the increase and decrease of the days, &c., are caused by the inclination of the axis of the earth to the plane of the ediptic, at an angle of 663, and

the inclination of the axis of the earth to the plane of the ecliptic, at an angle of 66½°, and how the axis, by remaining parallel to itself in all points of its path round the sun, invariably preserves this inclination.

Geode (½°5d), n. [Gr. geōdēs, earthy, from ge or gaia, earth.] In mineral. (a) a round for roundish lump of agate or other mineral, or a mere incrustation. Its interior is sometimes empty, and in this case the sides of its cavity are lined with crystals, as in agate balls. Sometimes it contains a solid movable nucleus and sometimes it is filled with able nucleus, and sometimes it is filled with

an earthy matter different from the envelope, whence the name. (b) The cavity in such a nodule.

such a hodde. Geodephaga (jē-ō-def'a-ga), n. pl. [Gr. gē, the earth, and diaphagō, to devour.] Predaceous land-beetles, a division of carnivodaceous land-neeties, a division of carnivo-rous coleopterous insects found generally beneath stones, clods, &c., subdivided into two very large families—the Cicindelida and the Carabida. Geodesian (jê-ō-dē'si-an), n. One versed in

geodesy.
Geodesic, Geodesical (jē-ō-des'ik, jē-ō-des'ik-al), a. Geodetic (which see).
Geodesy (jē-od'e-si), n. [Gr. geodatisia—gē, the earth, and daiō, to divide.] That branch of applied mathematics which determines the figures and areas of large portions of the earth's surface, the general figure of the earth, and the variations of the intensity of gravity in different regions by means of direct observation and measurement.
Geodetic Geodetical (jē-ō-def'ik jē-ō-det'.

drect observation and measurement.

Geodetic, Geodetical (jē-ō-det'ik, jē-ō-det'-ik-al), a. Pertaining to geodesy; obtained or determined by the operations of geodesy; engaged in geodesy; as, geodetic surveying; geodetic observers.

Geodetically (jē-ō-det'ik-al-li), adv. In a geodetical paper.

geodetical manner. Geodetics (jē-ō-det'iks), n. Same as Geodesy.

Geodiferous (jē-ōd-if'er-us), a. [Geode (which see), and L. fero, to produce.] Producing geodes.

geodes. Geoffroyia (jef-roi'a), n. [In honour of M. E. F. Geoffroy, a French physician.] A genus of West Indian and South American dicotyledonous trees, belonging to the papillonaceous tribe of the nat. order Leguminosse. The bark of G. inermis (Andira inermis of some botanists) possesses emetic, drastic nurgative and narroit properties. inermis of some botanists) possesses emetic, drastic, purgative, and narcotic properties, and in large doses is poisonous. It acts as a powerful anthelmintic. The fruit of Gesuperba, or umari, is much used by the inhabitants of Brazil on the banks of the Rio San Francisco. Geogenic (jē-ō-jen'īk), a. Same as Geogonic. Geoglossum (jē-ō-glos'sum), n. [Gr. gr, the earth, and glossa, tongue.] Earth-tongue, a genus of ascomycetous fungi found in bogs and meadows, all the species growing upon earth.

upon earth.

a gents of abounceous tanger tomain bogs and meadows, all the species growing upon earth. Geognost (je'og-nost), n. [See Geognost [Rare.] One versed in geognosty, a geologist [Rare.] Geognostic, Geognostic, Geognostic, Geognostic, Geognostic, Geognostic, Geognostic, Geognostic, Geognosty; geological. [Rare.] Geognosty (je'og'nō-si), n. [Gr. gē, the earth, and gnösis, knowledge.] That part of natural nistory which treats of the structure of the earth. It is the science of the substances which compose the earth or its crust, their structure, position, relative situation, and properties. [This word originated among the German mineralogists, and is nearly synonymous with geology.] Geognoic, Geognoical (je'ō-gon'ik, je'ō-gon'ik-al), a. Pertaining to geogony, or the formation of the earth.
Geognaph (je'og'o-ni), n. [Gr. gē, the earth, and gonē, generation.] The doctrine of the formation of the earth; geology.
Geographer (je'og'ra-fe'r), n. [See Geographer (je'og'ra-fe'r), n. [See Geographical Geographical (je'ō-graf'ik, je'ō-graf'ik, al), a. Relating to or containing a description of the terraqueous globe; pertaining to geography.
Geographically (je'ō-graf'ik-al-li), adv. In a geographical manner; according to the usual practice of describing the surface of the earth.
Geography (je'og'ra-fi), n. [Gr. gē, the earth, Geography (je'og'ra-fi), n. [Gr. gē, the earth, Geography (je'og'ra-fi), n. [Gr. gē, the earth, Geography (je'og'ra-fi), n. [Gr. gē, the earth,

the earth. Geography (jë-og'ra-fi), n. [Gr. gë, the earth, and graphë, description.] I. The science which treats of the world and its inhabitants; a description of the earth or terrestrial globe, particularly of the divisions of its surface, natural and artificial, and of the position of the several countries, kingdoms, states, citics &c. As a science recorraphy includes of the several countries, kingdoms, states, cities, &c. As a science, geography includes the doctrine or knowledge of the astronomical circles or divisions of the sphere, by which the relative position of places on the globe may be ascertained; and usually treatises of geography contain some account of the inhabitants of the earth, of their government, manners, &c., and an account of the principal animals, plants, and minerals.—General or universal peography, the science which conveys a knowledge of the earth, both as a distinct and independent body in the universe, and as connected with a system of heavenly bodies.— Mathematical

geography, that branch of the general science which is derived from the application of mathematical truths to the figure of the mathematical truths to the figure of the earth, and which teaches us to determine the relative positions of places, their longitudes and latitudes, the different lines and circles imagined to be drawn upon the earth's surface, their measure, distance, &c. earth's surface, their measure, distance, exc-—Physical geography, that branch of geog-raphy which gives a description of the principal features of the earth's surface, the various climates and temperatures, show-ing how these, together with other causes, affect the condition of the human race, and ing how these, together with other causes, affect the condition of the human race, and also a general account of the animals and productions of the globe. —Political geography, that branch which considers the earth as the abode of rational beings, according to their diffusion over the globe, and their social relations as they are divided into larger or smaller societies.—Sacred or biblical geography, the geography of Palestine, and other oriental nations mentioned in Scripture, having for its object the illustration and elucidation of Scripture history.—2. A book containing a description of the earth or of a portion of it. (Geologic, Geologian (jē-ol'o-jer, jē-ō-lō'ji-an), n. A geologist. [Rare.]
Geologic, Geological (jē-ō-loj'ik, jē-ō-loj'ik-al), a. [See Giology.] Pertaining to geology, or the science of the earth. Geologist (jē-ol'o-jist), n. One versed in the science of geology.

Geologically (jē-ōlojik-al-ii), adv. In a geological manner. Geologist (jē-ol'o-jist), n. One versed in the science of geology. Geologist (jē-ol'o-jiz), ni. To study geology; to make geological investigations; to discourse as a geologist. Geology (jē-ol'o-ji), n. [Gr. gē, the earth, and logos, discourse.] The science which deals with the structure of the crust of the globe, and of the substances which compose it; or the science of the minerals or aggregate substances which compose the earth, the relations which the several constituent masses bear to each other, their formation, structure, position, and history. It also investigates the successive changes that have taken place in the organic and inorganic kingdoms of nature; it inquires into the causes of these changes, and the influence which they have exerted in modifying the surface and external structure of our planet. It is a science founded on exact observation and careful induction, and is intimately connected with all the physical sciences. The geologist, in order that he may conduct his investigations with success, ought to be well versed in chemistry, mineralogy, zoology, botany, comparative anatomy, in short, every brunch of science relating to organic and inorganic nature. The rocks constituting the crust of the earth have been variously divided in accordance with their position and contents. The first great division is into unstructified and stratified. The unstratified rocks may belong to any age: they are divisible into two groups; those which represent stratified rocks, but have lost all trace of original form under powerful modifying influences (metamorphic); and those which from the first were unstratified. The unstratified rocks may belong to any age: they are divisible into two groups; those which represent stratified rocks, but have lost all trace of original form under powerful modifying influences (metamorphic); and those poured out on a land surface or a sea bottom, as the lavas of the oldest as well as of the most recent times; the latte the conversion of immed areas into crystaline masses. The stratified rocks have been deposited from water, and have been divided into metamorphic and fossiliferous. (See METAMORPHIC.) The fossiliferous strata have been divided into the following classes, have been divided into the following classes, founded on their fossil contents and the physical relations between the strata.—
Laurentian. Highly crystallized schists, quartzose rocks, and limestones. Fossils: Eozoön canadense and graphite. Locality: Canada, Hebrides, Bavaria, Norway.—Cambrian. Sandstones, slates, schists, and crystalline limestones. Fossils: sea-weed, shells, some crystages, especially trilohites. Locality: Locality. some crustacea, especially trilobites. Locality: North Wales or Cambria, Scotland, America (Huron).—Silurian. Sandstones,

conglomerates, limestones, metamorphic slates, schists. Fossils: stems and leaves of slates, schists. Fossils: stems and leaves of water-plants, club-mosses, sea-weeks, corals, graptolites, star-fishes, shells bivalve and univalve, and trilobites in very great abundunivaive, and trilontes in very great abundance; in upper beds, fishes, ganoid and placoid. Typical locality: Wales.—Devontan and Old Red Sandstone. Sandstones, limestones, shales. Fossils: sea-weeds, marshalats or hydrogeness to be former reads. and the states of the coal massive such states of the coals, shales fossils: sea-weeds, marshplants, as bulrushes, tree-ferns, reeds, &c.; corals, shells, crustacea. Locality: Devonshire. Old Red Sandstone. Sandstones and conglomerates. Fossils: chiefly large crustaceans, ganoid fishes, and a few plants. Locality: Scotland, Welsh Borders.—Curboniferous. Sandstones, linestones, shales, clays, ironstone, coal. Fossils: very numerous and gigantic tree-ferns, reeds, pines, palms, &c.; corals, encrinites, star-fishes, sea-urchins, sea and land shells, crustacea, fishes, labyrinthodonts. Trilobites appear for the last time.—Permian or Lover New Red Sandstone. Red and whitish sandstones, shales, mignesian limestone. Remains resemble those of the coal measures, but animals less numerous; labyrinthodonts and shales, magnesian limestone. Remains resemble those of the coal measures, but animals less numerous; labyrinthodonts and reptiles numerous and gigantic. Typical locality: Perm in Russia. — Typical locality: Perm in Russia. — Typical locality: Perm in Russia. — Typical state. Typical state of the state o Plants rare and imperfect, and apparently drifted. Animals numerous—sponges, corals, sea-unchins, star-fishes, and crustaceans. Shells plentiful and exquisitely beautiful in form and colour, notably ammonites and nautilus. Fishes not numerous, and characterized by their teeth. Reptiles gigantic, terrestrial in the Wealden. First appearance of bones of birds, and what seem to be bones of a monkey.—Tertiary. Remains resembling those now existing. seem to be bones of a monkey.—Tertury. Remains resembling those now existing, and a large proportion identical. Real exogens appear for the first time; fishes, birds, and mammals of existing families. Two great periods—warm and cold. Warm: gypsum, marls, nummulite limestone. Cold period: boulder clay unstratified and stratified, shell clays, gravels, &c. The tertiary has been further divided into Eocene, Microne, Pitocene, and Pleistocene, in accordance with the proportions of existing species cene, Plicene, and Pleistocene, in accordance with the proportions of existing species in the various strata. See separate entries.—Quaternary or Post-tertiary. Remains identical or nearly so with present life. Deposits: clay, sand, gravel, mud, peat, soil, &c. Divided into Prehistoric or Post-pleistocene, and Historic or Recent. Prehistoric: toene, and Historic or Recent. Prehistoric: Irish deer, woolly elephant, hairy rhinoceros, cave-hyena, cave-bear, mammoth; human remains, canoes, ashes, cave and lake dwellings, stone-weapons and implements, kichen-middens. Historic or Recent: deposits now forming. Species now existing or existing within the historic period.—Another division of stratified fossiliferous rocks is into Primary or Palæozoic (Laurentian, Cambrian, Silurian, Devonian and Old Red Sandstone, Carboniferous, Permian); Secondary or Mesozoic (Triassic, Jurassic, Cretacous); Tertiury or Cainozoic (see above), and Post-tertiary or Quaternary (see above). See Formation, Fossil, Organic, Rock, and Stratum.

and Stratum. Geomancer (jē'ō-man-sêr), n. One versed in or who practises geomancy.

Geomancy (jē'ō-man-si), n. [Gr. gē, the earth, and manteia, divination.] A kind of divination by means of figures or lines,

formed by little dots or points, originally on

the earth and afterwards on paper. Geomantic, Geomantical (jē-ō-man'tik, jē-ō-man'tik-al), a. Of or pertaining to Of or pertaining to reomancy.

Geometer (jë-om'et-èr), n. [Gr. geometrës. See GEOMETRY.] One skilled in geometry; a geometrician. Geometral (jē-om'et-ral), a. [Fr. géometral.]

Geometral (§-om'et-ral), a. [Fr. géometral.]

Geometric, Geometrical (§-ō-met'rik,]

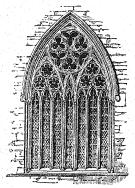

ō-met'rik-al), a. [Gr. geometrikos. See GEOMETRY.] Pertaining to geometry; according to the rules or principles of geometry;

done or determined by geometry.—Geometrical construction, the representation of a

proposition by geometrical lines.—Geometrical curves, or geometrical lines, those in

which the relation between the abscissa and

ordinates is expressed by a finite algebraical

Geometrical Decorated Window, Ripon Minster.

-Geometrical decorated, in arch applied to the earlier period of decorated Gothic, in which the tracery and other ornamentation consist entirely of distinct geometrical forms, the principle of verticality and unity by a subordination of parts being fully developed.—Geometrical elevation, a design for the front or side of a building drawn according to the rules of geometry, as opposed to perspective or natural elevation.—Geometrical locus. See Locus.—Geometrical progression, is when the terms increase or decrease by equal ratios; as, 2, 4, 8, 16, 32, or 32, 16, 8, 4, 2. See PROGRESSION.—Geometrical stairs, those stairs of which the steps are supported only at one end by being builded into the wall.

Geometrically (je-5-metrik-al-li), adv. In a geometrical manner; according to the rules or laws of geometry.

Geometrician (je-om'e-tri'shan), n. One

skilled in geometry; a geometer; a mathematician.

Geometridæ (jē-ö-metri-dē), n. pl. A very ex-tensive family of lepidopterous, nocturnal, or rather seminocturnal insects, known to or rather seminocturnal insects, known to collectors by the name of slender-bodied moth. More than 300 British species be-longing to this family are known. The family itself is divided into sixty genera. Geometrize (je-om'e-triz), v.t. To act ac-

family itself is divided into sixty genera. Geometrize (ë-om'e-triz), v. To act according to the laws of geometry; to perform geometrically; to proceed in accordance with the principles of geometry; to recognize or apprehend geometrical quantities or laws.

Geometry (jē-om'e-tri), n. [Gr. geōmetria—gē, the earth, and metron, measure—the term Geometry (geometria). It for geometria, the carth, and metron, measure—the term being originally equivalent to land-measuring or surveying.] The science of magnitude in general; the science which treats of the properties of definite portions of space; that science which treats of the properties of lines, angles, surfaces, and solids; that branch of mathematics which treats of the properties and relations of magnitudes. Geometry is the most general and important of the mathematical sciences; it is founded upon a few axioms or self-evident truths (see AXIOM), and every proposition which it lays down, whether it be theorem or problem, is subjected to the most accurate and rigid demonstration. Geometry has been distinguished into theoretical or speculative and practical. The former treats of the various properties and relations of magnidistinguished into theoretical or speculative and practical. The former treats of the various properties and relations of magni-tudes, with demonstrations of theorems, &c.; and the latter relates to the perform-

ance of certain geometrical operations, such as the construction of figures, the drawing of lines in certain positions, and the application of geometrical principles to the various measurements in the ordinary concerns of life. Theoretical geometry is again divided into elementary or common geometry divided into elementary or common generity and the higher geometry, the former being employed in the consideration of lines, superficies, angles, planes, figures, and solids, and the latter in the consideration of the higher order of curve lines and problems.—Analytical geometry, Descriptive geometry, See ANALITICAL, DESCRIPTIVE. Geo-navigation (jč'o-na-vi-gā'shon), n. A term proposed for that branch of the science of navigation in which the place of a ship at sea is determined by referring it to some other spot on the surface of the earth—in opposition to Caclo-navigation (which see).

Geonomy (jē-on'o-mi), n. [Gr. gē, the earth, and nomos, a law.] The science of the physical laws relating to the earth, including geology and physical geography.

Geophagism (jē-of'a-jizm), n. [Gr. gē, the earth, and phagō, to eat.] The act or practice of eating earth, as dirt, clay, chalk, &c. See DIRT-EATING.

Geophagist (jē-of'a-jist), n. One who practises geophagism; one who eats earth.

Geophila (jē-of'al-a), n. [Gr. gē, the earth, and phaloō, to love.] A small genus of creeping herbaceous plants of the nat. order Rubiaceae, natives of India and tropical America and Africa. The root of G. rentformis is emetic, and may be used as a substitute for ipecacuanha.

Geophilus (jē-of'al-us), n. [Gr. gē, the earth, and phalos, loving.] A genus of articulate animals, belonging to the order Chilognatha and class Myriapoda, including the G. electricus, or electric centipede, a species not uncommon in this country, which has the power of emitting light when excited.

Geoponic, Geoponical (jē-ō-pon'ik, jē-ō-pon'ik, al), a. [Gr. gē, the earth, and ponos, labour.] Pertaining to tillage of the earth or agriculture. 'Authors geoponical.' Sir T. Browne.

Geoponics (jē-ō-pon'iks), n. The art or science of cultivating the earth, and ponos, labour.] Pertaining to tillage of the earth or science of cultivating the earth, and ponos, labour.] Pertaining to tillage of the earth, and wholesome sallets, and other plain and useful parts of geoponics.' Evelyn.

Geoponics (jē-ō-pon'iks), n. The art or science of cultivating the earth, including the view of the geography of the earth, and horana, view.] A large hollow spherical globe or chamber, lined in the inside with cloth on which is depicted a general view of the geography of the earth inside with cloth on which is depicted a

earth. Geoteuthis (jē-ō-tū'this), n. [Gr. gē, the earth, and teuthis, a squid.] A genus of fossil squids or calamaries whose pens are found abundantly in the lias and solite formations. The ink-bag and other fragments in addition to the pens occur in the Oxford

clay.

Geothermic (jē-ō-thér'mik), a. [Gr. gē, the earth, and thermos, heat] Of or pertaining to the internal heat of the earth.

Geothermometer (je'ō-thér-mom'et-êr), n. [Gr. gē, the earth, and E. thermometer (which see).] An instrument for measuring the degree of terrestrial heat at different places, especially in mines and artesion wells.

gree of terrestrial heat at different places, especially in mines and artesian wells. Geotic' (jē-ot'ik), a. [Gr. gē, the earth.] Belonging to earth, terrestrial. Bailey. Geotropie (jē-ot-roy'ik), a. of or pertaining to, or exhibiting geotropism; turning or inclining towards the earth. Geotropie tendency. Francis Darwin. Geotropism (jē-ot'ro-pizm), n. [Gr. gē, the earth, and tropos, a turning, direction, from trepō, to turn.] Disposition or tendency to turn or incline towards the earth, as the characteristic exhibited in a young plant, when deprived of the counteracting influence of light, of directing its growth towards the earth. towards the earth.

The powers of growth which exist in young seedings would certainly be called instinctive if they existed in animals, and they are quite as indispensable as those just mentioned in supplying the wants which first arise. These two instincts are the power of directing the growth in relation to the force of gravity, and in relation to light; the first being called geotropism, the second heliotropism. Francis Darwin.

Gim, the second heliotropism. Francis Darwin.

Geotrupidæ (jë-ö-trup)-i-dë), n. pl. [Typical
genus Geotrupes -Gr. gë, the earth, trupao,
to pierce—and eidos, resemblance.] A family
of burrowing lamellicorn beetles of the
section Petalocera, in which the elytra are
rounded behind and cover the abdomen.
They inhabit temperate climates, and are
useful in removing disgusting substances,
as the excrementitious matter of men and
other animals. When alarmed they feign
death. The Geotrupes stercorarius, or watchman-beetle of Britain, is the type of the
family.

Gephyrea (ge-fi'rē-a), n. pl. [Gr. gephyra, a bridge.] A class of the Anarthropoda, comprising the spoon-worms (Sipunculus) and their allies.

Gerah (ge'ra), n. [Heb.] The smallest piece

Gerah (gera), n. [Heb.] The smallest piece of money current amongst the ancient Jews, the twentieth part of a shekel, or nearly three halfpennies. Ex. xxx. 13.

Geraniaceæ (jê-rāni-ā'sē-ē), n. [See Geran-NIUM.] A nat. order of exogens, the distinguishing character of which is to have a fruit composed of five cocci or cases, con-

nected with as many flat styles, consolidated round a long conical beak. These plants are usually astringent and odoriferous. The species of the order which inhabit Europe are herbaceous plants; a few of them are handsome, but the major part are mere

weeds.

Geranium (jē-rā'ni-um), n. [Gr. geranos, a crane—on account of the long projecting spike of the seed-capsule.] The crane's-bill genus, a genus of herbaceous plants (rarely undershrubs), the type of the nat. order Geraniaceu, natives of temperate regions throughout the world. They have usually palmately divided leaves and regular flowers, with ten, stomens and five carriels each with ten to the property of the carriels each stomens. palmately divided leaves and regular flowers, with ten stamens and five carpels, each tipped by a long glabrous awn (the persistent style). The flowers are usually blue or red, and are often handsome; the so-called geraniums of our gardens belong, however, to the genus Pelargonium (which see). There are about a dozen British species, of which the herb-robert (G. robertianum) is the most common.

Gerlo-antico (jer'lo-ant-te'kō), n. A fine,
rare, rich, flesh-coloured marble used for
statuary purposes in Rome.

Gerlond, † n. A garland. Chaucer.

Germ (jerm), n. [L. germen, an offshoot, a
germ—probably for gerimen, from gero, to
bear.] 1. In physiol. the earliest form under
which any organism appears; the rudimentary or embryonic form of an organism;
that which is in an undeveloped state; an
embryo; as, the germ of a fetus, of a plant, embryo; as, the germ of a fetus, of a plant, of a flower.

When one attempts to keep en rapport with modern scientific thought, one becomes imbued with the notion that distinct creative acts never took place, and that the primal germ is our legitimate ancestor in unbroken line. Scientific American. 2. That from which anything springs; origin; first principle; as, the germ of civil liberty

or of prosperity. Mr. Hunter's work on the blood . . . abounding in principles or the germs of principles.

planted or sown. The immediate causes of germination are the presence of moisture and atmospheric air and a certain elevation of temperature. Moisture softens the integuments of the seed and relaxes the tissue of the embryo; atmospheric air supplies oxygen and nitrogen; and a temperature, which must be at least as high as 32° Fahr., by exciting the vitality of the embryo, enables it to take advantage of the agents with which it is in contact. During germination various changes take place in the chemical constituents of the seed, and are usually accompanied with increase of temperature, as is seen in the process of malting. Along with these other changes commonly take place: a root is produced, which strikes perpendicularly downwards and, fixing itself in the soil, begins to absorb food; a growth upwards then commences and ends in the protension begins to absorb food; a growth upwards then commences and ends in the protrusion of a stem and leaves.

then commences and ends in the protrusion of a stem and leaves. Germinative (jermin-at-iv), a. Ofor pertaining to germination. Germ-theory. The theory that living matter cannot be produced by evolution or development from not-living matter, but is produced from germs or seeds. The theory more particularly concerns itself with the appearance of life, or with phenomena supposed to be dependent on the presence of living matter, where the germs are so infinitesimally minute as not to be capable of detection by the eye aided by the most powerful instruments. In this view it has two aspects—first, as it affects the question of the origin of life, and, second, as it affects the origin and propagation of many diseases. As it regards the doctrine of the origin of life see BIOGENESIS. As it affects the origin and propagation of disease it is maintained that the whole class of zymotic diseases, with many others, are due to the presence in the atmosphere of infinite multitudes of germs, chiefly spores of cryptogamic plants, as Bacteria and Torula (the yeast-plant), ready to become developed and multiply under favourable conditions, and by so doing to set up fermentation, putrafaction, or other morbid action in the bodies on or in which they are parasitic. All admit that many cutaneous diseases are due to the nation, or other morali action in the bodies on or in which they are parasitic. All admit that many cutaneous diseases are due to the presence of parasites propagated by spores, as also that certain diseases, as pebrine in silk-worms, 'blood' in cattle, malignant pussilk-worms, 'blood' in cattle, malignant pus-tules, &c., arise from the germs of animals or plants in the tissues or blood, but in regard to its wider application there is much contro-versy. A system of antiseptic treatment of wounds and sores has been founded upon this theory, with the view chiefly of prevent-ing the formation of pus on the surface of incised wounds, and pyamia, or blood-poisoning, occasionally occurring after oper-ations, especially in hospitals. This treatment consists in endeavouring to exclude germs or effect their destruction by the agency chiefly of carbolic acid.

Gerund (je'rund), n. [L. gerundium, from gero, to carry on or perform—because, according to the old grammarians, the gerund properly expressed the doing or the necessity of doing something.] The name given originally by grammarians to a part of the Latin verb used to express the meaning of the present infinitive active, when the infinitive outlit to stand in some other case than the nominative, but adopted into other languages to indicate various forms or modifications of the verb; thus, in Anglo-Saxon a dative form of the infinitive with to before it, is often called the gerund: as, Ie eom to nimanne, I am to take (or be taken). In Latin the gerund is a sort of verbal noun, having only the oblique cases, and possessing the same power of government as its verb, but resembling the noun in being governed by prepositions; as, studium obtemperandi legibus, a desire of obeying the laws. The early English or Anglo-Saxon gerund or dative of the infinitive was used chiefly to indicate end or purpose, like the Latin gerund or supine, or ut with the subjunctive. In English what seems to be a present participle governed by a preposition is sometimes denominated a gerund, in such phrases, for example, as 'fit for teaching,' fond of learning;' but here teaching and learning are merely verbal nouns (corresponding to the Anglo-Saxon nouns in -ung) governed by a preposition, the preposition or 'fit for the teaching of boys.' Gerundial (je-rundial), a. Pertaining to or resembling a gerund.

Geyser (grzer), n. [Icel. geysir, lit. the gusher, from geysa, to gush or rush forth; allied to E. gush.] The name given to springs or fountains of hot water such as were first observed in Iceland. The geysers of Iceland, nearly one hundred in number, lie about 30 miles north-west of Mount Hecland 16 miles north of the town of Skalholt, in a plain covered by hot springs and steaming apertures. The largest, called the Great Geyser, throws up at certain times a column of hot water, with loud explosions, to the height of over 200 feet, and this eruption terminates in a column of steam, which rushes up with amazing force and a thundering noise. The next most important is the New Geyser or Strokkur (churn). These springs are supposed to be connected with Mount Hecla. The geysers of Iceland are, however, surpassed by those which have been discovered in comparatively recent times in the Rocky Mountains in the Yellowstone Region. (See BOILING-SPRINGS.) The phenomenon, as experimentally illustrated by Tyndall, is due to the heating of the walls of a fissure, whereby the water is slowly raised to the boiling point under pressure and explodes into steam, an interval being required for the process to be repeated.

Glacial (gla'shi-al), a. [Fr., from L. glacials, from glacias, ice.] Loy; consisting of ice; frozen; having a cold glassy look.—

Glacial mosphoric acid, pure tribasic phosphoric acid. It is a transparent brittle solid, highly deliquescent.—Glacial acetic acid, the strongest acetic acid. It exists in a crystallized form under 50 Fahrenheit.—Glacial arift, in geal, see DRIFT.—Glacial period or epoch, in geal, that interval of time in the later tertiary period during which both the arctic regions and a great part of the temperate regions were covered with a sheet of ice, which formed a polar ice-cap. The epoch comprehended several alternations of warmth and cold, during which the ice-sheet shrank and expanded. The causes of the cold were partly astronomical and parbly geographical. The phenomena of the drift or boulder-clay are explained by reference to this period of externe cold, the explanation either taking the form of the ice-bery theory, which assigns the boulder-clay to the action of floating ice. the form of the icebery theory, which assigns the boulder-clay to the action of floating ice,

or of the glacier theory, which ascribes the chief work to great continental ice-sheets. The deposits of the glacial period are boulder-clays of more than one kind, separated by sands and clays, the whole resting on striated and ice-worn rock-surfaces; sands, gravels, and clays, the last containing the remains of animals whose proper habitat in regions farther north than where they are in regions farther north than where they are now found; erratics, or masses of rock trans-ported great distances and of such size that floating ice alone could have carried them; moraines, or the debris gathered in valleys by local glaciers such as now exist in various parts of the earth, even in the tropical mountain chains. The iceberg theory, once universally adopted, is now admitted as explanatory of only a small part of the phenomena.

Glacier (gla'shi-er), n. [Fr., from glace, L. glacies, ice.] An immense accumulation of ice filling a valley and pouring down its masses to valleys yet lower. Glaciers are those masses of snow-ice formed in lofty valleys above the line of perpetual congelation, whose prolongation comes down into the lower valleys, reaching frequently to the lower valleys, reaching frequently to

Glacier of Zermatt, Switzerland.

the appearance of frozen torrents, frequently several miles in length, traversed by deep rents called crevasses, and are composed of snow gradually solidified by compression into the granular mass known as nevs, which ultimately, the pressure being continued and alternate melting and freezing taking place within the glacier and on its surface, becomes transparent ice. They move gradually down into the lower valleys at a varying rate of 18 to 24 inches in twenty-four hours, bearing upon their surface large quantities of stones, some of them of enormous size, derived from the walls of the valley down which the glacier moves. These heaps of stones, which are deposited ultimately at the sides and lower termination of the glacier, are called lateral and terminal moraines. In mild seasons glaciers are

much reduced in size, and in cold seasons much enlarged. In the winter of 1818-19 some Swiss glaciers increased so greatly, and came so far down into the lower valleys, as to sweep away whole villages. Glaciers are found in many lofty mountain ranges, as the Alps, the Andes, &c.

The Alpine glaciers are from 10 to 15 miles long and from 1 to 2½ broad, and their mean vertical thickness ranges from 100 to 600 feet. Brande.

—Glacier theory, (a) the theory attributing important geological changes, as the erosion of valleys, the denudation of large portions of the earth's surface, the transportation and deposition of drift or boulder-clay, the accumulation of morames, &c., to the action of glaciers, which, during the glacial period, covered a large part of the frigid and temperate zones. See under GLACIAL.

(b) The name given to any theory accounting for the downward motion of glaciers. The principal glacier theories may now be said to be three, two of which agree in referring this motion to the effect of gravitation, but the one accounting for the coherence of the glacier by a certain viscosity inherent in ice, similar to that of treacle or honey, though differing in degree; and the other attributing it to the fact that, although the ice of which the glacier consists is being continually broken and disintegrated by the downward pressure of the parts of the glacier on each other, yet that these pieces immediately reunite through regelation taking place at the moist surfaces of the broken fragments. (See Regelation.) The former theory is that of the later that of Professor Tyndall. Principal Forbes claimed, on the announcement of Tyndall's theory of cohesion by regelation, that that doctrine was already involved in his theory. Charpentier, Saussure, Agassiz, Rendu, and others, had previously investigated and proposed theories accounting for the river-like motion of glaciers, but the older of these erred in that they regarded glaciers as more or less solid and rigid bodies. The third theory, that of Professor James Thomson, assigns the motion of the glacier to the melting and freezing of alternate portions of the ice mass subjected to pressure. The first push of the ice from the feeding-ground of the glacier is soon exhausted, but the change of form of the ice to w

Gladiator (glad'i-āt-èr), n. [L., a swordsman, one who fought at public games, from gladius, a sword.] 1. In Rom. antig. one who fought in public for the entertainment of the people. Gladiators were at first prisoners, slaves, or condemned criminals; but afterwards freemen fought in the arena, either for hire or from choice. Under the empire knights, senators, and even women exhibited themselves in this way. Gladiators were first exhibited only on the occasion of public funerals, but afterwards at entertainments of various kinds, and especially at public festivals given by the ediles and other magistrates; they usually fought in the amphitheatre, sometimes in the forum, sometimes at the funeral pyre. They were kept and trained in special establishments or schools, sometimes by persons who let them out for hire, sometimes by citizens who wished to exhibit them themselves. Gladiators were divided into different classes according to their arms or mode of fighting. Thus retiarii were such as carried a kind of trident and a net (rete), in which they endeavoured to entangle their opponents; Thraciums were those armed with the round shield or buckler of the Thracians and a short sword or dagger; the mirmillones had an oblong shield curved. the Thracians and a short sword or dagger; the mirmillones had an oblong shield curved the mrmutones had an olong sheat curved to suit the shape of the body; secutores were another class usually pitted against the retiarii. In case the vanquished was not killed in the combat the people were allowed to decide his fate. If they decreed his

Gland (gland), n. IL glans, glandis, an acorn.) 1. In anat. a distinct soft body, formed by the convolution of a great number of vessels, either constituting a part of the lymphatic system, or destined to secrete

some fluid from the blood. Glands have been divided into conglobate and conglomerate, from their structure; but a more proper division is into tymphatic and secretory. The former are found in the course of the lymphatic vessels, and are conglobate. The latter are of various structure. They include the mucous follicles, the conglomerate glands properly so called, such as the parctid glands and the pancreas, the liver, kidneys, &c. The functional classification of these is into assimilating or absorbent glands as those of the lymphatics and lacteals, and the secreting, as the pancreas, &c.; the liver combines hold functions. The term has also been applied to other bodies of a similar appearance, neither lymphatic morsecretory, the ductless or vascular glands, such as the spleen, thymus, and thyroid glands, whose use is not certainly known, certain portions of the brain, as the pineal and pituitary glands, &c. See Conglonate and Conglo-MERATE.—2. In bot. (a) a wartlike swelling found on the surface of plants, or at one end of their hairs. Glands are very various in form. Thus, there are miliary glands, which are small and superficial, appearing under the form of small round grains disposed in regular series, or scattered without order on all parts of the plant exposed to some fluid from the blood. Glands have in form. Thus, there are mutury younter, which are small and superficial, appearing under the form of small round grains disposed in regular series, or scattered without order on all parts of the plant exposed to the air; vesticular glands, small reservoirs full of essential oil, and lodged in the herbaceous integument of vegetables, as in the leaves of the myrtle and orange; globular glands, which are of a spherical form, adhering to the epidermis only by a point: they are observed particularly in the Labiate; utrividar glands or ampullae, which are filled with a colourless fluid, as in the ice-plant; papillary glands, something like the papille of the tongue; they occur in many of the Labiate; lenticular glands, which are of a round depressed form, and appear peeping through the cuticle of the stem of the common willow and other similar plants. Some of these are borne upon stalks, others sessile, or attached to the plant without any appendage. Lenticular glands do not appear to have any function connected with secretion, but seem rather to be the rudiments of roots which never develop themselves. (b) A one-celled, compound inferior fruit, with a dry pericary, as in the oak.—3. God (god), n. [This word occurs throughout the Teutonic languages in forms varying but little from each other. The root meaning of the word is unknown, and though the temptation is strong to connect it with good, yet when we follow both words through the Teutonic languages we find that they must be looked upon as radically distinct. The state of the case is well put by Max Müller in the following extract:—There is perhaps no etymology so generally acquiesced in as that which derives God from good. In Danish good is god, but the identity of sound between the English God and the Danish god is merely accidental; the two words are distinct and are kept distinct in every dialect of the Teutonic family. As in English we have God and good, we have in A. Sax. God and god; in Gothic Guth and god; in Old High German Cot and cuot; in German Gott and gut; in Danish Gud and god; in Outch God and god; in Dutch God and god. Though it is impossible to give a satisfactory etymology of either God or good, it is clear that two words which thus run parallel in all these

dialects without ever meeting cannot be dialects without ever meeting cannot be traced back to one central point. God was most likely an old heathen name of the Deity, and for such a name the supposed etymological meaning of good would be far too modern, too abstract, too Christian.' In Icel. we find god applied to heathen deities (neuter and almost always plural), and afterwards changed to Gud, to signify God, while god (with long o) means good. The word seems to have been originally neuter among all the Teutonic peoples, and to have become masculine only after their conversion.]

A term applied to the various styles of pointed architecture prevalent in Western Europe from the middle of the twelfth century to the revival of classic architecture in the sixteenth. The term was originally applied scornfully by the Renaissance architects to every species of art which existed from the decline of the classic styles till their revival, but so far from being now used in a depredatory sense, it is regarded as characterizing one of the noblest and completest styles of architecture ever invented. The chief characteristics of Gothic architecture are:—The predominance of the pointed arch and the subserviency and subordination of all the other parts to this chief feature; the tendency through the whole composition to the predominance and prolongation of vertical lines; the absence of the column and entablature of classic architecture, of square edges and rectangular surfaces, and the substitution of clustered shafts, contrasted surfaces, and members multiplied in rich variety. The Gothic architecture of Britain has been divided into four principal epochs—the Early English, or general style of the thirteenth century; the Decorated, or Britain has been divided into four principal epochs—the Early English, or general style of the thirteenth century; the Decorated, or style of the fourteenth century; the Perpendicular, practised during the fifteenth and early part of the sixteenth century (Flamboyant being the contemporary style in France); and the Tudor, or general style of the sixteenth century. See the separate terms and the illustrations under them.

I believe then, that the characteristic or moral elements of Goldnic are the following, placed in the order of their importance:—[1] Sawageness; [2] Changefulness; [2] Naturalism; [4] Grotesqueness; [8] Rigidity; [6] Redundance.

And I repeat that the withdrawal of any one, or any two, will not at once destroy the Goldnic character of a building, but the removal of a majority of them will.

1. A constitutional disorder or disease giving rise to paroxyams of aente pain with a specific form of inflammation, often favoured by original or hereditary constitution, appearing after puberty chiefly in the male sex, and returning after intervals. It is very often preceded by, or alternates with, disorder of the digestive or other internal organs, and is generally characterized by affection of the first joint of the great toe, by nectural exacerbations and morning remissions, and by vascular plethora, various joints, organs, or parts, becoming affected after repeated attacks without passing into suppuration. It may be acquired or hereditary. In the former case, it rarely appears before the age of thirty-five; in the latter, it is frequently observed earlier. Indolence, inactivity, and too free use of tartareous wines, fermented liquors, and very high-seasoned, fat, and nourishing food, are the principal causes which give rise to this disease. Gout is also called, according to the part it may affect, Padagra (in the feet), Gonagra (in the knees), Chiragra (in the hands), &c. It may be acute or chronic, and may give rise to concretions, which are chiefly composed of urate of soda.

(c) A father; a master or superior; an employer; an elderly person. [Slang.] (d) One who steers a ship; a pilot. Jam. iii. 4. (e) A contrivance in mills and machinery for maintaining a uniform velocity with a varying resistance. A common form of the steamengine governor is shown in the annexed figure. It represents a spindle kept in motion by the engine. A and B are two centrifugal balls, CA and OB the rods which suspend the balls. These rods cross one another and pass through the spindle at c, where the whole are connected by a round pin put through the spindle and the rods which serves as the point of suspension for the centrifugal balls or revolving pendulums. A piece of brass M is made to slide up and down upon the upper part of the spindle, and to this piece (c) A father; a master or superior; an em-

the end of the lever No, whose fulcrum is at P, is attached. This piece of brass is also connected with the ball rods by two short pieces and joints DB, FG. When the engine goes too fast, the balls fly farther asunder and depress the end N of the lever, which partly sluts a throttle-valve connected with the end O, and thus diminishes the quantity of steam admitted into the cylinder; and on the other hand, when the engine goes too slow, the balls fall down towards the spindle and elevate the end N of the lever, which partly opens the throttle-valve and increases the quantity of steam admitted into the partly opens the throttle-valve and increases the quantity of steam admitted into the cylinder. By this ingenious contrivance, therefore, the quantity of steam admitted to the cylinder is exactly proportioned to the resistance of the engine, and the velocity kept constantly the same. A similar contrivance is employed in mills to equalize the motion of the machinery. When any part of the machinery is suddenly stopped, or suddenly set agoing, and the moving power

remains the same, an alteration in the velo-city of the mill will take place, and it will move faster or slower. The governor is used to remedy this. (f) See GAS-GOVERNOR. Governor-general (gu'vern-er-jen'er-al), a. A governor who has under him subordinate

The grains vary in size from that of a pin'shead to a mass of 2 or 3 feet, but they seldom exceed the size of a large gaming die. When they are of this size, or larger, the granite is said to be 'coarse-grained.' Some varieties of granite are evidently of ignoous origin, but there is reason to believe that many granites are rocks originally stratified, but subsequently so highly netamorphosed as to have become crystalline throughout, and lost all trace of stratification and lamination. Granite is one of the most abundant as to have become crystalline throughout, and lost all trace of stratification and lamination. Granite is one of the most abundant rocks seen at or near the surface of the earth, and was formerly considered as the foundation rock of the globe, or that upon which all sedimentary rocks repose; but it is now known to belong to various ages from the Laurentian to the tertiary, the Alps of Europe containing granite of the later age. In alpine situations it presents the appearance of having broken through the more superficial strata; the beds of other rocks in the vicinity rising towards it at increasing angles of elevation as they approach it. It forms some of the most lofty of the mountain chains of the eastern continent, and the central parts of the principal mountain ranges of Scandinavia, the Alps, the Pyrenees, and the Carpathian Mountains are of this rock. No organic fossil remains have ever been found in granite, although it is sometimes found overlying strata containing such remains. Granite supplies the most such remains. Granite supplies the most durable materials for building, as many of the ancient Egyptian monuments testify. It varies much in hardness as well as in colour, in accordance with the nature and proportion of its constituent parts, so that there is much room for care and taste in its selection. Granite in which felspar predominates is not well adapted for buildings, as it cracks and crumbles down in a few years. The abordeen bluish gray granite is celebrated for its great durability, and also for its beauty. The Peterhead red granite, the nee of which is due to its felspar being the fiesh-coloured potash variety called orthoclase, is highly esteemed for polished work, as columns, pillars, graveyard monuments, &c. Granite in which mica is replaced by ornblende is called syenite; when both nich and hornblende are present it is called syenite granite; the granite granite, when tale supplants mica it is called protogene; a mixture of quartz and hypersthene, with scattered flakes of mica, is called hypersthene granite; and the mane of graphic granite, or pequatite, is given to a variety composed of felspar and quartz, with a little white mica, so arranged as to produce an irregular laminar structure. When a section of this latter nations of the constituent materials, broken lines resembling Hebrew characters present themselves, hence the name. such remains. Granite supplies the most durable materials for building, as many of lines resembling Hebrew characters present themselves; hence the name. Granitel, Granitelle (gran'i-tel), n. [Dim.

Gravitate (gravi-tāt), v.i. pret. & pp. gravitated; ppr. gravitating. [Fr. graviter, from L. gravitas, from gravis, heavy.] To be affected by gravitation; to exert a force or pressure upon, or tend to move under the influence of gravitation; cravitation (grav-tāt'shom), n. The act of gravitating of tending to a centre of attraction; the force by which bodies are pressed or drawn, or by which they tend toward the centre of the earth or other centre, or the effect of that force. The attraction of gravitation exists between bodies in the mass, and acts at sensible distances. It is thus distinguished from chemical and cohesive attractions, which unite the particles of bodies together, and act at insensible distances, or distances too small to be measured.—Terrestrial gravitation, gravitation which respects the earth, orly which bodies descend or tend towards the centre of the earth. All bodies, when unsupported, fall by gravitation to wards the centre of the earth. All bodies, when unsupported, fall by gravitation to tiscentre.—General or universal gravitation by which all the planets tend towards one another, and by which all the bodies and particles of matter within the universe tend towards one another. The theory of universal gravitation was established by Sir Isaac Newton, who laid down the law that every particle of matter within the universe attracts every other particle with a force

universal gravitation was established by Sir Isaac Newton, who laid down the law that every particle of matter within the universe attracts every other particle with a force proportional directly to the product of the numbers representing their mass, and inversely to the square of the distance separating one from the other. Gravitative (gravi-tāti-iy), a. Causing to gravitate or tend to a centre. Calexidge. Gravity (gravi-ti), n. [Fr. gravite; L. gravitas, from gravia, heavy. See Grave, a.] I. 4. The tendency of a mass of matter toward a centre of attraction, especially toward the centre of the earth; centripetal force; terrestrial gravitation.—5. In music, lowness or depth of tone or note.—Centre of gravity. See CRNTRE.—Absolute gravity, that by which a body descends freely and perpendicularly in a vacuum or non-resisting medium.—Relative gravity, that by which a body descends when the absolute gravity is constantly counteracted by a uniform but inferior force, such as in the descent of bodies down inclined planes, or in resisting mediums, as air and water.—Specific gravity, the weight belonging to an equal bulk of every different substance; the relative gravity or weight of any body or substance considered with regard to the weight of an equal bulk of some other body which is assumed as a standard of comparison. The standard for the specific gravities of solids and liquids is pure distilled water at the temperature of 62° Fahr, which is reckoned unity, and by comparing the weights of equal bulks of other bodies with this standard we obtain their specific gravities. Thus, if we take equal bulks of water, silver, and platinum, and weigh them, the silver will be found to be 10 5 times and the platinum 21 4 times heavier than the water; and reckoning the specific gravity of water unity, the specific every different substance; the relative gratimes heavier than the water; and reckoning the specific gravity of water unity, the specific gravity of silver is said to be 10.5 and that of platinum 21.4. The practical rule is, weigh the body in air, then in pure distilled water, and the weight in air divided by the loss of weight in water will give the specific gravity of the body. One substance is said to have a greater specific gravity than another when a given bulk of the former weighs more than the same bulk of the former weighs more than the same bulk of the latter. In designating the specific gravities of gases the standard or unity is atmospheric air.—Line of direction of gravity, the straight line which passes through the centre of gravity of a body in a direction towards the centre of the earth; the line which the centre of gravity describes

a direction towards the centre of the earth; the line which the centre of gravity describes when the body is allowed to fall freely.

Guillotine as used in Paris.

The condemned is strapped to a board, which in the cut is shown resting horizontally on the table in front of the upright posts, but which is easily drawn forward and set upright when necessary, and again

canted over upon the table and rapidly moved up so as to place the neck of the condemned within the semicircle of the lower plank, the other being raised for the purpose. On the right of the table is a large basket or trough of wicker-work for the reception of the body. Under the place where the head rests is an oblong trough for its reception. The knife is fixed to the cup or lintel on the top of the posts by a claw in the form of an 8, the lower part of which opens as the upper part closes. This claw is acted upon by a lever to which a cord is attached. When the head of the condemned is in position the cord is pulled, and by the action of the lever the knife is set at liberty, descending by the grooves in the upright posts and falling upon the neck of the condemned just behind the planks which keep the head in position. The scaffold, which is surrounded by an open railing, is raised 6 or 7 feet from the ground.—2. A machine which cuts by a knife descending between grooved posts, much used for cutting paper, straw, &c. Called also Guillotine-cutter. In the case of a field or siege piece it unites, for travelling, with a forepart, fixed on a pair of wheels, termed a limber, to which the horses are attached, so as to form a single four-wheeled carriage. In action it is unlimbered, and then rests on its wheels, and on a strong support termed the trail.—The protected barbette gun-carriage, called also the Monerieff gun-carriage (after its inventor Major Monerieff), is designed to store up the force of recoil on firing, and of applying it to the work of raising the gun to fire over the force of recoil on firing, and of applying it to the work of raising the gun to fire over a high parapet. When fired the gun descends under cover by its own recoil, assuming at the same time the loading position, in which it is retained by a toothed wheel and ratchet. When re-loaded, by releasing the ratchet, it is brought by a counterweight, the ratchet, it is brought by a counterweight, which the force of the recoil has elevated, back to its original position. The carriage moves laterally on a circular rail-laid on the platform, and can easily be turned in any direction. The same inventor has also designed a hydropneumatic carriage, in which the force is stored up in the form of air, which is highly compressed in a strong iron cylinder.

gutta. gum, and percha, the tree from which
it is obtained.] A substance resembling
caoutchous in many of its properties, but
stronger, more soluble, and less elastic. It
is obtained in the state of a milky-looking
union which bewleas or better avoiced to is obtained in the state of a minky-looking juice, which hardens on being exposed to the air, and is the sap of a large tree of the genus Isonandra, the *I. Gutta* of Hooker, nat. order Sapotaceæ. The tree abounds in the Malayan Peninsula and in some of the islands of the Eastern Archipelago.

Gutta percha comes to us in two forms; the one is in thin films or scraps, some-thing similar to clippings of white leather; the other is in rolls formed by rolling the thin layers together in a soft state. When the other is in rolls formed by rolling the thin layers together in a soft state. When pure the slips are transparent and some-what elastic, verging in colour from a whitish yellow to a pink. Below the tem-perature of 50° gutta percha is as hard as

wood, excessively tough, and only flexible in the form of thin slips. By an increase of heat it becomes more flexible, until at a temperature considerably below the boiling-noint of water it becomes as soft as bees'temperature considerably below the boiling-point of water it becomes as oft as bees-wax. It is now easily cut and divided by a knife, and may be moulded into all varieties of forms with the greatest ease, or it may be cut and united again so perfectly as scarcely to exhibit even the appearance of a joint, and possessing all the strength of an undivided mass. Whatever be the shape into which it is formed in the soft state it will retain precisely the same form as it cools, hardening again to its previous state with retain processly the same form as the cools, hardening again to its previous state of rigidity, and the process of softening and hardening may be repeated any number of times without injury to the material. Gutta times without injury to the material. Gutta percha is, in a great measure, devoid of clasticity, in which respect it offers a striking contrast to caoutchouc; but it possesses an astonishing degree of tenacity, and offers great resistance to an extending force. When once drawn out, however, it remains, without contracting, in the same position. It is soluble with difficulty in ether and other caoutchouc solvents, but very readily in oil of turpentine and naphtha. Gutta percha has been applied to a variety of purposes—as a substitute for leather; as an insulating coating for the copper wires of submarine telegraph cables; as an ingredient in mastics and cements; for the mannfacture of flexible hose, tubes, bottles, soles submarine telegraph cables; as an ingredient in mastics and cements; for the mannfacture of flexible hose, tubes, bottles, soles of shoes, &c. H.

H, the eighth letter of the English alphabet, often called the aspirate, as being a mere aspiration or breathing, though not the only aspirated letter in English. The sound that distinctively belongs to it is that which it has at the beginning of a syllable either before a vowel, as in hard, heavy, or after (in spelling, but really before) w, as in where, when (=hwere, hwen). Classing it by this sound it may be regarded (though authorities are not quite agreed upon the subject) as a continuous surd consonant, being produced very far back in the throat by an unchecked emission of breath, accompanied with a very slight approximation of being produced very far back in the throat by an unchecked emission of breath, accompanied with a very slight approximation of the root of the tongue to the back of the throat, and probably a slight tension of the vocal chords. It is more closely allied to k (including the hard sound of c), y, and ny k (in sing) than to any of the other consonants. To represent the sound just described, however, is only a comparatively small part of the duty it has to perform; it is also very commonly joined to other consonants to represent sounds for which there are no special lotters in the alphabet, as in the digraphs ch, sh, th (child, ship, thin, this, or in other consonantal combinations of various origins and values, as in the words enough (gh=f), plough (gh silent), philoso-quby (ph=f), rhetoric th silent), &c. Rh and ph are found only in words borrowed or derived from the Greek and Latin. Ch is also common in words taken from the Greek, but in this case it generally has the k sound, as in chemistry, chale, logomachy, &c. This letter, along with most of the others in the Anglo-Saxon alphabet, into which it passed from the Greek. In the Greek alphabet it latterly was used to represent & [e long), but originally and at the time when borrowed by the Latins trepresented the rough breathing or aspirate. In Anglo-Saxon it appears

generally to have been more strongly guttural than in most Latin words, often corresponding to the rough guttural his ferman much. In many words formerly spelled with this guttural h alone, we now find the h strengthened by the addition of a g before it, though the combination is now often silent altogether, as in night (A. Sax. nith), thought (A. Sax. thohh), &c. (See G.) In Old English such words were often written with a character distinct from g or h, and when this was dropped both these letters seem to have been considered necessary to give the proper guttural sound. In some words coming to us from the French it is silent when initial, as in hour, honour, honest. In A. Sax. h frequently occurs at the beginning of a syllable before l, n, and r, positions from which it has since fallen out. Comp. hlaft, loaf; had, load; hrafen, rawen, hring, ring; hrif, roof; innecea, neck, &c. According to Grimm's law, when the same roots or words occur in English and Latin or Greek (with which Sanskrit generally agrees), h in English represents k in the latter languages; thus, E. heart=L. corn, cordis, Gr. kardia; E. horn=L. cornis; E. head (O.E. keafod)=L. caput, Gr. kephalē; E. hound=L. canis, Gr. kylön (dog); E. hemp Gr. kunnabis, &c.—In music, H is the German equivalent for B natural, B being with them our B flat.—As a numeral in Latin, H denotes 200, and with a dash over it \$100,000.—As an abbreviation a numeral in Latin, H denotes 200, and with a dash over it H 200,000.—As an abbreviation in Latin, H stands for homo, heeres, hora, &c.—In English, H.M.S. stand for his (her) majesty's ship or service. Hall (hal), n. [A. Sax. hagal, hagal, hagal, hagal, hall, comp. G. D. Dan. and Sw. hagal, hagal, hagal, hall. Perhaps from a verb hag, to hack or out, hall being regarded as pieces cut small. For a similar softening or disappearance of g, comp. fall, natl, fair, vay, &c.] The small masses of ice or frozen vapour falling from the clouds in showers or storms. These masses consist of little spherules united, but not all of the same consistence, some being as hard and solid as perfect ice, others soft, like frozen snow. Hallstone assume various figures; some are round, others angular, others pyramidical, others

flat, and sometimes they are stellated with six radii, like crystals of snow. Hall occurs chiefly in spring and summer, and is always chiefly in spring and summer, and is always accompanied with electrical phenomena, and not unfrequently with thunder. It usually precedes storms of rain, sometimes accompanies them, but never, or very rarely, follows them, especially if the rain is of any duration. The time of its continuance is always very short, generally only a few minutes. The usual size of hail-

stones is about 1 inch in diameter, but they are frequently of much larger dimensions, sometimes even 3 and 4 inches in diameter. are frequently of much larger dimensions, sometimes even 3 and 4 inches in diameter. Hailstorms are very destructive to crops, particularly in hot climates. The phenomena attending the formation and fall of hail are not well understood; the dry state in which they fall shows that they have been exposed to cold below of C. This cold is probably due to the meeting of currents of unequal temperature and electric tension. In temperature regions the storms usually come with the prevalent winds of the district. Probably when hailstones are formed they are carried along through the atmosphere by currents of wind in a direction very oblique to the horizon, by which means they may be kept suspended a sufficient length of time to acquire the dimensions they possess by congealing the particles of humid vapour with which they successively come in contact. Hail-rods, upon the same principle as lightning-rods, have been erected in Germany and Switzerland with the view of subtracting the superrbundant electricity from the clouds and preventing the formation of hail; but they have not been attended with the success which was expected.

A luminous ring or circle, either white or coloured, appearing round the sun or moon. Sometimes one only appears, and sometimes several concentric circles appear at the same time; when the circles are of small diameter they are usually called corona. Halos are at times accompanied with other phenomena, such as parhelia, or mock-suns; paraselence, or mock-moons, and variously arranged white bands, crosses, or arcs. All these appearances are believed to be the result of certain modifications which light undergoes by reflection, refraction, dispersion, diffraction, and interference when it falls upon the crystals of ice, the rain-drops, or the minute particles that constitute fog and clouds.—2. Applied to any circle of light, as to the 'glories' surrounding the heads of saints.—3. A coloured circle round the nipple; an areola.—4. See TEMPERAMENT.—Close harmony is when the sounds composing each chord are placed so near to each other that no sound belonging to the chord could again be interposed between any of those already present.—Spread harmony is when the sounds of a chord are placed at such a wide distance from each other that some of them might be again

interposed between the sounds already prenterposed between the sounds already present.— Harmony or music of the spheres, the music imperceptible to human cars, produced by the movements of the heavenly bedies, according to the belief or hypothesis of Pythagoras and his school. Pythagoras supposed these motions to conform to certain fixed laws which could be expressed in numbers, corresponding to the numbers which give the harmony of sounds. It is to this hypothesis that Shaksnere refers in the this hypothesis that Shakspere refers in the following passage:-

this hypothesis that Shakspere refers in the following passage:—

Look how the floor of heaven
Is thick inlaid with matters of bright gold;
There's not the state of the which thou behold'st Burin his motion like an angel sings,
Still quiring to the young-ey'd cherubine:
Such harmony is in immortal souls;
But, whilst this muddy vesture of decay
Doth grossly close it in, we cannot hear it.

saxon, differ from the modern harp in wanting the front pillar. There are no representations of the Hebrew harp of undoubted accuracy. The modern harp is nearly triangular in form, and the strings are stretched from the upper part to one of the sides. It stands erect and is played with both hands, the strings being struck or pulled by both fingers and thumb. Before its improvement by Errard, the harp was uned in the principal key, and modulations effected by pressure of the thumb, or by turning the tuning-pins of the strings which it was desired to alter. Errard first added seven pedals to the instrument, which were moved by the foot of the performer, and afterwards constructed adouble-action harp with seven pedals. The larp thus constructed contains forty-three strings tuned according to the diatonic scale, every eighth string being a replicate in another octave of the one counted from. By means of the pedals each string can be sharpened twice, each time a semitone, so that the instrument is capable of rendering the full chromatic scale, and of modulating into all the keys of the tonal system. Its range is six octaves, being from double E below the bass to E in altissimo.—2. A constellation, otherwise called Lyra or the Lyra.—3. or killed. We must have him out, Harry.

—To have it out of a person, to punish him; to retailate on him; to take him to task.—

Have is used as an auxiliary verb to form certain compound tenses, as the perfect and pluperfect of both transitive and intransitive verbs, the past participle of which completes the tense either alone or with some other auxiliary. In such cases the word have no doubt originally had its proper meaning as a transitive verb, and was so used at first only with other transitive verbs, as denoting the possession of the object in the state indicated by the past participle of the latter verb; thus I have received a letter, means literally I possess a letter received. The construction was afterwards extended to cases in which the poswards extended to cases in which the pos-sessor of the object and the performer of

the action are not necessarily the same, as in *I have written a letter*, and to intransitive verbs. In the same way the Latin habere, to have, has come to be used as an auxiliary or merely a formative element in the conjugation of the verb in the Romance languages

Having little or nothing. Though a man be haveless.

Gower.
